The present invention relates to human testis expressed Patched like CC protein (HTPL, see ABV78759 to ABV8762 and ABB88519 to ABB88520). HTPL protein (HTPL, see ABV78759 to ABV8762 and ABB88519 to ABB88520). HTPL brotein (HTPL, see ABV78759 to ABV88612 to ABB88520). HTPL CC has two isoforms, with a few single base pair differences between the cwo. One of the single base pair changes introduces a premature stop codon in HTPL-8 (S for short) compared to HTPL-16. Lf for long). HTPL compared structural features strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL is important in regulating male germ cell development, and the HTPL gene was important in regulating male germ cell development, and the HTPL, and in cueful for diagnosing a disorder caused by mutation in HTPL, and in therapy and manufacture of a medicament for treatment or prevention of therapy and manufacture of a medicament for treatment or prevention of therapy and manufacture of a medicament for treatment or prevention of the HTPL. Such disorder associated with decreased expression or activity of human compared or colon function. HTPL proteins and nucleic acids are shelteral muscle or colon function. HTPL proteins and nucleic acids are clinically useful diagnostic markers and potential therapeutic agents for example from the invention

Claim 4; Page 78; 149pp; English.

The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma, conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, cumour angiogenesis, diabetic retinopathy, macular degeneration, conversation, arthritis, psoriasis, verruca vulgaris, angiofibroma of tubercous sclerosis, port-wine stains, Sturge weber syndrome, leukaemia, osteoprosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. The method comprises the use of one or more theraples to the treatment is treated by administering (I) to the patient in conjunction with one or more of other theraples such as radiation or conjunction with one or more of other theraples such as radiation or conjunction with one or more of other theraples such as radiation or conjunction with one or more of other theraples such as radiation or call, by contacting (I) is useful for reducing ERG activity in a cell, by contacting (I) with RMJ, in the presence of a divalent confiseases related to the expression of ERG, and as diagnostic tool to examine genetic drift and mutations within diseased cells or to detect the presence of ERG RNA in a cell. (I) is useful for specifically contacting genes that share homology within diseased cells or conditions and consymptic mucleic acid molecules which regulate expression of ERG, and conjunction of the invention

The invention relates to a nucleic acid molecule (I) which down regulates corpression of an Eta-related gene (ERG). (I) is useful for treating capression of an Eta-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, cumour angiogenesis, diabetic retinopathy, macular degeneration, cumour angiogenesis, diabetic retinopathy, macular degeneration, cumour angiogenesis, versuce where syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. The method comprises the use of one or more therapies or the treatment. Heukaemia or tumour conditions suitable for the treatment. Leukaemia or tumour conjunction with one or more of other therapies such as radiation or chaptonesis is treated by administering (I) to the patient in conjunction with one or more of other therapies such as radiation or chaptonesis is treated by administering (I) to the patient in conjunction with one or more of other therapies such as radiation or chaptonesis is treated by administering (I) to the patient in conjunction with one or more of other therapies such as radiation or chaptons with the presence of advalent cation such as Mg2+. (I) is useful for diagnosis of conditions and cation such as Mg2+. (I) is useful for diagnosis of conditions and cation such as Mg2+. (I) is useful for diagnosis of conditions or the expression of ERG fusion genes. ABK13354-ABK22719 represent mucleic acids, including antisense and cargamatic uncleic acid molecules which regulate expression of ERG, and corpuse of the invention

```
The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino acids (SI, ABB83999), a sequence having 65% sequence of 6711, (S1), having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHL 1 is a proto-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small GrPases as well as downstream components of the signal transduction pathway. (I) is useful for identifying a specific binding partner. (I) and nucleic acids (II) for identifying a specific binding partner. (I) and nucleic acids (II) are useful for adiagnoshing, monitoring disagnoshing and treating caused by altered expression of human POSHL1 including diagnoshing and treating caused by altered expression of human POSHL1 including diagnoshing are useful for measuring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The customer is sequence is that of a scanning oligonucleotide useful in examples of the invention. Note: The present sequence did not form part of the printed specification, but is based on sequence information supplied to berwent by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL -1, useful for treating disorders associated with decreased expression or activity of human POSHL1.

The invention relates to a typing kit for judging human leukocyte antigen (HLA) genotype of a sample by hybridising a substrate on which 10-24 base oligonucleotides (ABL30512-ABL31809) originating in the sequences of genes e.g. belonging to HLA class I antigens on human genome and containing gene polymorphisms as alloantigens have been immobilised as primers for amplification of cleaved nucleic acids relating to gene polymorphisms. The method is useful for judging HLA genotypes of individuals by determining immunogenetic differences before transplanting between them, providing genetic information to decide compatibility of organ and tissue for transplantation e.g. of bone marrow, kidney, liver, pancreas, Langerhans islet in pancreas and cornea, susceptibility diagnosis of genetic diseases and identifying individuals
                                                                                                                                                                                                                                                                                                                                                                                                                                  Human leukocyte antigen (HLA) typing, useful for judging HLA genotypes of individuals e.g. by determining immunogenetic differences when transplanting between them.

Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases.

Claim 3; Page 54; 72pp; English.

The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor regulates expression of a sequence encoding a subunit of nuclear factor regulation. The enzymatic nucleic acid molecule is adapted to treat configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A.

(I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially Mg^2+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or calling reastant cancer. The method involves use of other drug therapises such as monoclonal antibodies, REL-A-specific inhibitors or chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, cyclophosphamide, docxoubin, fluorouracil carboplatin, edetrexate, gencitabine or radiation therapy. The enzymatic and antisense nucleic acid molecules are also useful for treating inflammatory disease such as colorestal, restenosis, asthma, crobin's disease such as colosisty, autoimmune disease, lupus, multiple solerosis, transplant/graft rejection, gene therapy applications, ischaemiar/seperfusion injury sepsis, allergic airway inflammation, inflammatory bowel disease or infection. This sequence represents the substrate of a novel enzymatic contraction.

Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases.

Claim 3; Page 34; 72pp; English.

rhe invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B (NREM), where (I) is an inozyme, zinzyme, G-Claever or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially MG-2+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, antisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug therapies such as monoclonal antibodies, REL-A-specific inhibitors or cherapic such as monoclonal antibodies, REL-A-specific inhibitors or cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate,

```
Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor
acid molecules are also useful for treating inflammatory disease such as rheumatoid arthritis, restemosis, asthma, Crohm's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, gene therapy applications, ischaemia/reperfusion injury (central nervous system (CNS) and myocardial), glomerulonephritis, espesis, allergic airway inflammation, inflammatory bowel disease or infection. This sequence represents the substrate of a novel enzymatic nucleic acid molecule
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Enzymatic nucleic acid; nuclear factor kappa B; NFKB; inozyme; zinzyme; G-cleaver; amberzyme; cancer; REL-A activity; breast cancer; human; lung cancer; prostate cancer; colorectal cancer; brain cancer; oesophageal cancer; stomach cancer; bladder cancer; pancreatic cancer; cervical cancer; head and neck cancer; ovarian cancer; malanoma; lymphoma; glioma; multidrug resistant cancer; REL-A-specific inhibitor; common expressy; paclitaxal; docetaxel; cisplatin; methortexate; colophosphanide; docetaxel; cisplatin; methortexate; cyclophosphanide; docetaxel; cisplatin; detrexate; gencitabine; radiation therapy; inflammatory disease; asthma; diabetes; rheumatoid arthritis; restences; Crohn's disease; deshim; diabetes; rheumatoid arthritis; restences; lupus; multiple sclerosis; sechsemia; gene therapy; autoimmune disease; lupus; multiple sclerosis; sechsemia; allergic airway inflammation; inflammatory bowel disease; infection; ss.

configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. treating a patient having a condition associated with the level of REL-A. The presence of advalent cation, especially MG-2+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug therapies such as monoclonal antibodies, REL-A-specific inhibitors or chemotherapy including paclitaxel, doctaxel, displant, methotrexate, gencitabine or radiation therapy. The enzymatic and antisense nucleic cancel molecules are also useful for treating inflammatory disease such as chemotherapy as also useful for treating inflammatory disease such as the manual disease, lupus, multiple sclerosis, transplant/graft rejection, gene therapy applications, ischaemia/repeaffusion injury rejection, alergic alrway inflammatory bowel disease or sepsis, allergic alrway inflammation, inflammatory bowel disease or infection. This sequence represents the substrate of a novel enzymatic

requiration. The enzymatic nucleuc acts miscure (1) which down configuration. The enzymatic nucleic acid molecule (1) which where (1) is an inozyme, zinzyme; G-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regularing REL-A activity in a cell, for treating a sequence of REL-A gene, in the presence of a divalent cation, especially MG'2+. The enzymatic and the presence of a divalent cation, especially MG'2+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, corvical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug therapies such as monoclonal antibodies (REL-A-specific inhibitors or chemotherapy including paclitaxe), docetaxel, cisplath, methotrexate, colophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, desense nucleic acid molecules are also useful for treating inflammatory disease such as rhematoid arthritis, restenosis, asthma, Crohn's disease such as rejection, gene therapy applications, ischaemia/reperfusion injury cepterion, gene therapy applications, ischaemia/reperfusion injury cepterion, and moreous system (CMS) and myocardial), glomerulomephritis, especial acid molecule are infection, inflammation, inflammatic of a novel enzymatic cinfection. This sequence represents the substrate of a novel enzymatic

Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases.

Claim 3; Page 54; 72pp; English.

The invention describes an enzymatic nucleic acid molecule (1) which down regulates expression of a sequence encoding a subunit of nuclear factor requisation. The enzymeatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A.

(1) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially MG2-f. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic, cervical, head and name cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug therapies such as monoclonal antibodies, REL-A-specific inhibitors or chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, or emiticable or radiation therapy. The enzymatic and antisense nucleic acid molecules are also useful for treating inflammatory disease such as theumatoid arthritis, restencisis, asthma, Crohn's disease, diabetes, celection, gene therapy applications, isohaemia/reperfusion injury (central nervous system (CNS) and myocardial), glomerulonephritis, sequence represents the substrate of a novel enzymatic acid molecule. This sequence represents the substrate of a novel enzymatic

New zinc finger-containing proteins and nucleic acids, useful in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7 or MDZ12, e.g. cancer.

Example 8; SEQ ID NO 399; 103pp; English.

The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ3, MDZ4, MDZ12, MDZ3 is canceded at chromosome 7422.1, MDZ4 is encoded at chromosome 6921.3-22.2, MDZ7 is encoded at chromosome 602.2 is encoded at chromosome 602.3 in an expression of mDZ3, MDZ4, MDZ3,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule act useful for reducing HER2, K-Ras, H-Ras, and HIV acid molecules are useful for treating breast, ovarian, colorectal, lung, prostate, also useful for treating breast, ovarian, colorectal, lung, prostate, shown in NaZS9889 - ABZ62216, ABZ64544 - ABZ65531, ABZ65200 - ABZ65214, ABZ65531, ABZ65310 - ABZ65524,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Nucleic acid molecule, Hepatitis C virus, HCV; Hepatitis B virus; HBV; RNA stability; RNA expression; RNA synthesis; antisense; enzymatic nucleic acid; hammerhead riboxyme; DNAzyme; inozyme; amberzyme; G-cleaver riboxyme; decoy molecule; aptamer; HBV reverse transcriptase; Enhancer I region; viral replication; degenerative; disease state; HBV infection; HCV infection; cirrhosis;

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HHV) or Honocleic acid molecules include antisense and enzymatic nucleic acids such as harmerhead ribozymes, DNAzymes, or inozymes, zinzymes, amberzymes, and G-cleaver ribozymes, Also disclosed are nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase primer sequences, as well transcriptase and/or HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV CC as oligonucleotides that specifically bind the Enhancer I region of HBV Genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HV virfection, replication and gene certains are active the present sequence espression such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence espressent in the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ä
liver failure, hepatocellular carcinoma, hepatotropic, cytostatic; virucide, antiinflammatory, substrate; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Lee

Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus nfection.

WPI; 2003-229207/22.

Claim 1; Page 251; 387pp; English.

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as harmerhead ribozymes, DNAzymes, and enzymatic nucleic acids such as harmerhead ribozymes, DNAzymes, or inozymes, zinzymes, amberzymes, and G-cleaver ribozymes, Also disclosed are nucleic acid decoy molecules and G-cleaver ribozymes, Also disclosed transcriptase and/or HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds and methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene carcinoma. The present sequence represente a substrate for one of the HCV invertion.

C DNAzyme or minus strand DNAzyme sequences disclosed in the present

The invention relates to a nucleic acid molecule which encodes a Na+/H+ exchanger like protein (NHELPI). The NHELPI nucleic acid molecule, NHELPI polypeptide, an antibody against the protein or its antigen-binding fragment is useful in therapy. The NHELPI nucleic acid molecule, NHELPI polypeptide and an agonist are particularly useful for manufacturing a medicament for treating or preventing a disorder associated with antigen-binding fragment, and an anteagonist, are useful for manufacturing a medicament for treating or preventing a disorder associated with increased expression or activity of human NHELPI. The NHELPI for manufacturing increased expression or activity of human NHELPI. The NHELPI molesic acid or protein is useful as passive replacement therapy, as a vaccine, or in diagnostic methods. This sequence corresponds to a 17-mer oligonucleotide spanning the sequence of the human NHELPI gene (ADC03514).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New human sodium-hydrogen exchanger like protein 1 (NHELP1), useful as passive replacement therapy or as a vaccine for treating or preventing disorders associated with aberrant expression or activity of human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

The invention relates to a nucleic acid molecule which encodes a Na+/H+ exchanger like protein (NHELP1). The NHELP1 nucleic acid molecule, NHELP1 polypeptide, an antibody against the protein of its antibading fragment is useful in therapy. The NHELP1 nucleic acid molecule, NHELP1 polypeptide and an agonist are particularly useful for manufacturing a medicament for treating or preventing a disorder associated with decreased expression or activity of human NHELP1. The antibody or its antigen-binding fragment, and an antagonist, are useful for manufacturing a medicament for treating or preventing a disorder associated with increased expression or activity of human NHELP1. The NHELP1 andacturing a nuclean structuring a medicament for treating or preventing a disorder associated with or protein is useful as passive replacement therapy, as a vaccine, or in diagnostic methods. This sequence corresponds to a 1-mer oligonucleotide spanning the sequence of the human NHELP1 gene (ADC03514).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   plant growth; plant growth trait modulation; Brassicaceae; Arabidopsis; Brassica; Zea; Oryza; Triticum; Hordeum; Lolium; Sorghum; Glycine; Medicago; Helianthus; Lactuca; Beta; Vitis; Solanum; Lycopersicon; Capsicum; Gossypium; Hevea; Linum; Prunus; Citrus; Populus; Pinus;

PCR primers AAAS8474-A58541 were used to amplify open reading frames (ORFs) 8 to 41 of the BLM (Bleomycin) gene cluster. The proteins encoded by the gene cluster are useful for producing peptides and/or polyketide metabolites, especially bleomycin or bleomycin analogues. They are also useful for chemically modifying biological molecules to produce branched methyl groups, and for coupling amino acids and fatty acids. They may be reacted with an apo-carrier protein and coenzyme A to produce a holocarrier protein. The BLM gene cluster or catalytic domains can be used hidividually or collectively to produce thiazolidine, thiazoline, bithiazoline and bithiazoline—containing microbial metabolites. The BLM gene cluster may also be used to produce sugars

New genotyping oligonucleotide, useful for detecting the presence, absence or identity of single polymucleotide polymorphism in a nucleic acid sample.

Claim 1; Page 66; 83pp; English

rng.res

Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide polymorphisms SNPs. The present invention cities of single nucleotide polymorphisms SNPs. The present invention includes kits for determining the presence or absence of a SNP, using the includes kits for determining the presence or absence of a SNP, using the cligonucleotides of the invention. The PCR primers are used to amplify a SC pligonucleotides of the invention. The PCR primers are used to amplify a cligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The performing a single-nucleotide primer extension reaction. The cligonucleotides are useful for determining the presence, absence or dentity of a SNP and for genotyping nucleic acid samples, for e.g. to assess by association analysis the genotype of an individual or group of individuals, having a pathological phenotypic trait suspected of being caused by one or more SNPs. Phenotypic traits include diseases e.g. or agammaglobulinemia, diabetes insipidus, lesch Nyhan syndrome, muscular dystrophy, familial hypercholesterolaemia polycystic kidney disease, osteogenesis imperfecta and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial clisease of which a component is or may be genetic such as autoimmune diseases, including, rheumatoid arthritis, multiple sclerosis, inflammation, cancer, nervous system diseases and infection and containing DNA sequence represents a PCR primer specific containing DNA sequence

Reelin protein CR-50 epitope region, useful for diagnosis and treatment of cerebral disturbance.

Example 2; Page 7; 16pp; Japanese.

The present invention describes the mouse realin protein CR-50 epitope region, which contains the CR-50 antibody recognition site and is free from Fepordin domains and repetitive sites. Also described are: (1) an expression vector comprising a polymucleotide encoding a realin protein epitope region; (2) host cells with transfected the expression vector;

(3) polypeptides prepared by culture of the host cells; and (4) polynucleotides comprising the 351 base sequence given in ABE40165 which pencedes the 117 amino acid sequence given in ABE06244; and (5) use of the polynucleotide for diagnosis and/or treatment of diseases caused by abnormal positioning of neural cells, and stimulation of association of reelin protein. The mouse reelin protein CR-50 epitope region has neuroprotective activity, and can be used in the diagnosis and treatment of cerebral disturbance due to an abnormal reelin gene and positioning of neurons. The present sequence represents a PCR primer for the mouse reelin protein CR-50 epitope region, which is used in an example from the present invention 888888888888888

New isolated nucleic acid involved in growth regulation in human colonic epithelial cells, termed CATX, for diagnosing and treating abnormal cell growth, and for use as a probe/primer for detecting tumors.

Example, Page 88; 130pp, English.

The invention relates to an isolated nucleic acid (1) involved in growth regulation in human colonic epithelial cells, termed CATX. (1) is useful as a probe-primer for detecting tumours, preferably colon cancer. The nucleic acid, encoded polypeptide and antibody are useful in diagnosis and treatment of abnormal cell growth (such as cervical cancer, mealsonmas, colorectal adenocarcinomas, wilms' tumour, leukaemias and lymphomas), in screening assays for the treatment of abnormal cell growth, for raising antibodies, and to screen for peptide analogues and antagonists. (1) is useful as a biomarker for human tumour cells, e.g., colon cancer cells, for generating probes and primers designed for identifying and/or cloning homologues in other cell types, in antisense largament, so that premaismant cells can be identified prior to their spreading throughout the human body. (I) allows early detection

New isolated nucleic acid involved in growth regulation in human colonic epithelial cells, termed CATX, for diagnosing and treating abnormal cell growth, and for use as a probe/primer for detecting tumors.

Example, Page 87; 130pp; English.

The invention relates to an isolated nucleic acid (I) involved in growth regulation in human colonic epithelial cells, termed CATX. (I) is useful as a probe/primer for detecting tumours, preferably colon cancer. The nucleic acid, encoded polypeptide and antibody are useful in diagnosis and treatment of abnormal cell growth stumour, leukaemias and and treatment of abnormal cell growth, to raising antibodies, and to screen for peptide analogues and growth, for raising antibodies, and to screen for peptide analogues and growth, for raising antibodies, and to screen for peptide analogues and contagonists. (I) is useful as a biomarker for human tumour cells, e.g., colon cancer cells, for generating probes and primers designed for identifying and/or cloning homologues in other cell types, in antisense therapy, and in tissue profiling. (I) identifies cancer cells at an early crappy and in tissue profiling. (I) identifies cancer cells at an early crappy and in to spread of the cancer cells and early conting spreading throughout the human body. (I) allows early detection of potentially cancerous conditions and treatment of the cancerous conditions prior to spread of the cancer cells throughout the human potential conditions prior to spread of the cancer cells throughout the hody. Or prior to development of an irreversible cancerous condition. ABK27426-CC primers of the invention

The present invention describes a protein which is fused with a monoclonal antibody against an antigen present on cell surface and which can transfer a gene by combining with the gene and containing a human type single-stranded monoclonal antibody and a peptide which is the combining site for the gene. Also described is a complex of a monoclonal antibody-fused protein which is a complex of monoclonal antibody-fused protein and a math a method for the preparation of a monoclonal antibody-fused protein against a receptor present on cell surface in antibody-fused protein against a receptor present on cell surface in such a minoclonal antibody against a receptor present on cell surface is used as the template to amplify a single-stranded antibody gene of a course type monoclonal antibody by PCR; (2) the framework portion of the mouse type monoclonal antibody by PCR; (2) the framework portion of the antibody gene of a human type monoclonal antibody is converted to prepare a single-stranded immunoporter gene; and (4) the human type single-stranded immunoporter gene; and in a microbe to prepare a recombinant protein of the human type single-stranded immunoporter. Also described is a method for introducing the above complex of monoclonal antibody-fused protein of the through a cell surface receptor. The method is used for the preparation of surface. The present sequence represents an oligonucleotide which is used in an example from the present invention

The present invention relates to human chondroitin 6-sulfotransferase (C6ST) proteins and polynucleotides encoding such proteins. Sequences of the invention are useful in the molecular study of human extracellular matrix, for studying the biological functions of chondroitin 6-sulphate (C6S), in screening test for detecting C6ST polymorphs, for ascertaining and evaluating the role C6ST plays in atherosclerosis and for identifying potential therapeutics, i.e., inhibitors of enzyme or modulators of gene expression. The present DNA sequence is a PCR primer which is used for amplifying human C6ST gene
                                                                                                                                        Human, chondroitin 6-sulfotransferase, C6ST, chondroitin 6-sulphate, C6S, biological function; extracellular matrix; atherosclerosis; therapeutic; gene expression; enzyme; PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel recombinant human chondroitin 6-sulfotransferase polynucleotide segment, useful in molecular study of human extracellular matrix, and for studying biological functions of chondroitin 6-sulfate.
                                                                                                           Human C6ST gene amplifying 5' PCR primer #3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Disclosure; Col 17; 15pp; English.

The patent discloses growth inhibitory genes induced by retinoids. The invention also relates to recombinant expression constructs that express a reporter gene under the transcriptional control of a promoter for a gene which is expressed by retinoid induction. The promoter does not contain a retinoic acid response elements (RARE) site. The invention that her tealstes to reagents and methods for identifying compounds other than retinoids that modulate the expression of cellular genes. These compounds are useful for treating cancers such as promyelocytic leukaemia and cancer chemoprevention. The present DNA sequence is a PCR primer which is used for amplifying human secreted cell adhesion protein beta IG.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Leinamycin biosynthesis gene cluster; Lmn; open reading frame; ORF; anti-tumour antibiotic; broad spectrum antimicrobial activity; dram-negative; fram-negative bacteria; chemical modification; metabolite; apo-carrier protein; holo-carrier protein; tumour; polyketide; hybrid polypeptide/polyketide metabolite; Inm production; cytostatic;
                                                                                                                                                                                                                                                          Expression construct encoding cellular genes, under control of a promoter regulated by retinoids and cells comprising the construct for identifying compounds that induce expression of the genes useful in treating cancer.

The present invention relates to the isolation of the Streptomyces atroolivaceus leinamycin (Lnm) biosynthesis gene cluster containing 71 cpn reading frames (ORFS) (ORFS) distrough -1.0 ORFS inma through lnm2, and ORFS +1 through +9). Leinamycin is a novel anti-tumour antibiotic containing an extinity against Gram-positive and Gram-mogative bacterum containing a method of produced by several Streptomyces species. It exhibits broad spectrum containing a method of the boat cell is a bacterium or enkaryotic cell, including a mammalian, yeast, plant, fungal, or insect cell. The molecule is an endogenous metabolite produced by the host cell. The molecule is an endogenous metabolite produced by the host cell. The molecule is an endogenous metabolite produced by the host cell. The molecule is an endogenous metabolite produced by the host cell. The sexpenously supplied containing a mino transferame. The polypeptides encoded by the Lnm gene cluster for converting an apo-carrier protein to a holo-carrier or are useful for converting an apo-carrier protein to a holo-carrier or making various peptide and/or polyketide, and/or hybrid compiled and/or polyketide and/or polyketide and/or hybrid constitution with other active domains to modify various target substrates. The Lnm gene cluster is useful to make various modified Lnm. Lnm, its analogue, or other polyketide, cendogenous man production to the proteins encoded by the ORFS are condogenous man production with other active domains to morphy condens and control polyketide and condens or their polyketide, or other polyketide, condens to make various modified Lnm. Lnm, its analogue, or other polyketide, condens to append the supplied and condens and production in cells and condens to make various modified Lnm. Lnm, its analogue, or other polyketide, condens an anumber of disorders depending upon the condogenous mand production and number of disorders dependent an anumber of disorders dependent an anumber of supply dependent and the supplication with the supplication with the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ô

The present invention relates to the isolation of the Streptomyces atroolivaceus leinamycin (Lnm) biosynthesis gene cluster containing 71 open reading frames (ORFs) (ORFs) (ORFs - 15 through - 1, ORFs nm4 through lnm2, and ORFs + 1 through + 9). Leinamycin is a novel anti-tumour antibiotic produced by several Streptomyces species. It exhibits broad spectrum can information activity against Gram-positive and Gram-negative bacteria, but not against fungi. The polypeptides encoded by the Lnm biosynthesis content of the best cell is a bacterium or eukaryotic cell, including a mammalian, yeast, plant, fungal, or insect cell. The molecule in a mammalian, yeast, plant, fungal, or insect cell. The molecule is an endogenous metabolite produced by the host cell or exogenously supplied or an amino acid, and the polypeptide is a peptide synthetase or amino transferase. The polypeptides encoded by the Lnm gene cluster modules and/or catalytic domains are useful for converting an apo-carrier protein to a holo-carrier protein. Dum shows potent antitumour activity in tumnur models in vivo. The Lnm gene cluster modules and/or catalytic domains are useful for making various peptide metabolites. The proteins encoded by the ORFs are useful alone, or in combination with other active domains to modify various target substrates. The Lmm gene cluster is useful to upregulate endogenous Lnm production in cells and/or to make various modified Lnm. Lnm, its analogue, or other polyketide, peptide metabolites are useful as endogents. Created to permit Lnm production in cells and/or to treat a number of disorders, depending upon the type of metabolites. Abx3420-AAX4431 represent PCR primers used to amplify and individual ORFs of the S atroolivaceus leinamycin biosynthesis
                                                                                                                                                                                                                                                                                Novel gene cluster responsible for synthesis of leinamycin in
Streptomyces atroolivaceus useful for making various peptide and/or
polyketide, and/or hybrid polypeptide/polyketide metabolites.

Treating kappa-type multiple myeloma in a subject by administering a K121 -like antibody not conjugated to a toxin or a cytolytic agent. Example 8; Fig 9d; 65pp; English.

antibody heavy chain variable region. The primers were used to construct antibody heavy chain variable region. The primers were used to construct at X121-like antibody by oligonuclectide assembly using PCR. The K121-like antibody competes with K121 for binding to kappa-type myeloma cells. The K121-like antibody is used in the method of the invention. The specification describes a method for treating kappa-type multiple myeloma in a subject, comprising administering a K121-like antibody which is not conjugated to a toxin or a cytolytic agent. The method is useful for treating kappa-type multiple myeloma, autologous haematopoietic cell transplantation, killing kappa-type myeloma cells in a mixed population of cells and inducing apoptosis in kappa myeloma antigen (KMA) bearing

Diagnostic kit, useful for assessing a subject's tolerance of drugs, comprises reagents for determining alleles of genes encoding detoxification enzymes.

Claim 6; Page 17; 156pp; German

This invention describes a novel diagnostic kit for determining tolerance of pharmaceuticals in humans by determining allelic variability of at least two polymorphisms of a human enzyme involved in phase I and/or I constitute two polymorphisms of a human enzyme involved in phase I and/or I constructed the detoxification mechanism in a blood, tissue or other human sample, where tolerance is determined from presence or absence of alleles. The kit comprises two pairs of agene for a human detoxification mechanism amplifies, by PCR, part of a gene for a human detoxification mechanism associated enzyme. The kit may also contain two further pairs of oligonucleotides, serving as probes for detection of amplified DNA segments, especially where the probes are complementary to a single strand of one allele of the target gene. The probes are labelled with segments, especially where the probes are complementary to a single strand of one allele of the target gene. The probes are labelled with construction. The enzymes detected include NAT2, CYP2D6, CYP3A4, mEH, TPMT, WHYER, paraxonaee, CYP2C9, CYP2C19, CYP2E1 or DPD.

CYP3A4, mEH, TPMT, WHYER, paraxonaee, CYP2C9, CYP2C19, CYP2E1 or DPD.

CYP3A4, mEH, TPMT a suitable dose and/or to predict if a subject will show xide-effects to a drug. The kit provides minimally invasive, safe and reliable determination of the metabolic capacity of phase I and/or II cenzymes at the molecular level. This sequence represents a probe used in constant of the kit of the invention.

New oligonucleotides, useful for rapid detection of beer-spoilage bacteria by in situ hybridization, are specific for type, genus or species

Claim 1; SEQ ID NO 428; 88pp; German.

This invention describes novel oligonucleotides used in a method for detecting beer-spoilage bacteria in a sample. The bacteria detected include lactic acid bacteria of the genera Lactobacillus or Pediococcus, especially the species L. coryniformis, L. perolens, L. buchneri, L. plantarum, L. fructivorans, L. lindneri, L. casei, L. brevis or P. damnosus or Gram-negative bacteria of the genera Pectinaus and Generalister, specifically P. frisingensis, P. cerevisiphilus and M. cerevisiae. The oligonucleotides of the invention provide rapid detection of spoilage bacteria (typically within 48 hours, compared with 7-12 days for conventional culture methods), can detect all relevant bacteria in parallel, can differentiate between species of the same genus, and are method of the invention.

It was used in reverse transcription PCR to determine expression patterns of the FGF8 gene in cultured cells. These cells had been grown in low oxygen conditions, and had differentiated to form various types of neuronal cell. The different expression patterns can be used to determine which set of conditions promotes the differentiation of each type of neurone. The different cell types can be used for tissue transplantation, to treat disorders such as stroke, brain and spinal cord neurodegenerative disorders, Huntington's disease, other neurological disorders and psychiatric disorders parkinson's disease, neurological

The invention relates to a retinoid X receptor-gamma (RXR-gamma) knockout

mouse whose germ and somatic cells contain an insertion of an exogencus

mouse whose germ and somatic cells contain an insertion of an exogencus

containing portions of the RXR-gamma gene (exons 3 and 4) which

encode the entire DNA binding domain of RXR-gamma. The knockout mouse is

deficient in the normal expression of RXR-gamma. The invention

concompasses mice which are either homozygous or heterozygous for the

defective RXR-gamma gene, and also encompasses mammalian particularly

concontaining an exogenous DNA insert within exors 3 and 4. The

concontaining an exogenous DNA insert within exors 3 and 4. The

conclusion and antagonists of identifying RXR-gamma

agonists or antagonists using the transgenic mouse or marmalian cell

colline. The generically regimeered mouse and cell line are useful in

colline. The generically engineered mouse and cell line are useful in

collass of receptors. The mouse and cell line allow the investigation at

collass of receptors. The mouse and cell line allow the subscription of the importance of each of the RXR-gamma and in vivo levels of a system that lacks one or more

containing development and physiology. They are useful in studying any

contained development and physiology. They are useful in studying any

contained analysis of RXR-gamma reverse transcription-PCR (RT-PCR) primers used

contained analysis of RXR-gamma reverse transgenic mice of the invention. The

present sequence is an RT-PCR primer for exon B5 of the mouse RXR-gamma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New genetically engineered mice containing alterations in the gene encoding retinoid X receptor, useful for identifying agonists and antagonists of the receptors and in studying retinoic acid mediated gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention provides the protein and coding sequences of several novel human proteins, designated NOVX. These can be used in the treatment of, amongst others, cancers, autoimmune diseases, infections, inflammatory diseases, storage disorders, muscle disorders, neurodegenerative diseases and developmental defects. The present sequence is a PCR primer or probe used to isolate the sequences of the invention. All of the probes are modified at the 5' end by TBT and at the 3' end by TBMRA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Cell culturing; embryonic stem; ES; central nervous system; fgf8; dopaminergic; cholinergic; serotonergic; antiparkinsonian; nootropic; neuroprotective; anticonvulsant; tranquilizer; vulnerary; neuroleptic; cerebroprotective; cell therapy; gene therapy; CNS; PCR primer; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel isolated polypeptide, designated NOVX, useful for treating or preventing in NOVX-associated disorders e.g. cardiomyopathy, atherosclerosis, diabetes, cancer, allergy, asthma, Crohn's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The patent discloses a method of screening mammals for autoimmune diseases by identifying polymorphisms in interleukin (IL)-12 p40 gene. The methods and kits of the invention are used for screening individuals, families and populations for disease conditions or predispositions for the development of a disease condition which is characterised, exacerbated or associated with Th1/Th2 dysregulation in amammal. They are used to treat, prevent or disapnose autoimmune diseases such as IDDM (Insulin dependant diabetes mellitus). The present DNA sequence is mammalian IL-12 p40 intron 7 allelic variant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; NOVX; autoimmune disease; cancer; infection; inflammatory disease; storage disorder; muscle disorder; neurodegenerative disorder; nootropic; developmental defect; neuroprotective; antiparkinsonian; hypotensive;

Culturing cells such as neuronal cells for use in treating neurological disorders, comprises generating embryoid bodies from undifferentiated embryonic stem cells, selecting precursor cells, expanding and differentiating them.

Example 10; Page 41; 66pp; English.

The invention provides a method of culturing cells. The method involves expanding a culture of undifferentiated embryonic stem (ES) cells, contrain method embryonic by culturing the bodies (EB), culturing the bodies to select for central nervous system (CNS) precursor cells (PC), culturing policy of the expanded PC to form a culture of differentiated neuronal cells are useful for culturing the expanded PC to form a culture of differentiated neuronal cells which are useful for treating and cells. The method is useful for culturing undifferentiated neuronal cells which are useful for treating and neurological disorder, especially Parkinson's disease in a patient. A gene product such as tyrosine hydroxylase, nerve growth factor (NGF), brain derived neuronal cells which are useful for culturing dopaminergic, cholinergic actor (GDNF) NT-3, and NT-4/5 can be introduced into a brain of a subject. The method is useful for culturing dopaminergic, cholinergic and serotonergic neuronal cells. The differentiated neuronal cells are useful for treating neurological disorders such as Huntington's disease, all planer's disease, multiple sclerosis, severe seizure disorders (contrained policy, familial dysautonomia as well as injury or trauma to the nervous system such as neurotoxic injury or disorders for measure disorders cuch as addiction and schizohrenia, cerebrovascular disorders such as stroke and CNS disorders resulting from adjing. Assays are useful for developing drugs capable of regulating the survival, proliferation or genesis of neuronal cells and to screen for antagonist or agonist of companies 20-40% dopaminergic neurons and 1-3% astrocytes are useful for studying the mechanism of neuronsmitter synthesis and release, particularly for serotonin and dopamine, neuronal cells survival, and the companies 20-40% dopaminergic neurons and 1-3% astrocytes are useful for studying the mechanism of neuroransmitter synthesis and release, particularly for serotonin and dopaminer neuronal cells survival, and the electrophysiochem

Identifying agent that modulates GPR43 function, useful for treating migratine, soltzophrenia, anxiety, by measuring binding of GPR43 polypeptide to short chain fatty acid in presence and absence of candidate modulator.

Example 2; Page 80; 136pp; English.

The invention relates to identifying an agent that modulates function of G-protein coupled receptor GPR43. The method involves measuring the binding of GPR43 polypeptide to short chain fatty acid [II] in presence and absence of [III], or measuring signaling activity of GPR43 contacted with [II] in presence and absence of [III], or measuring signaling activity of GPR43 in presence of [II] and comparing the activity to activity measured in a sample in which GPR43 is contacted with [II] at its ECSO. The agents identified are useful for modulating the activity of GPR43 in a call and for modulating polencyhounclear (PMN) chemotaxis in a mammal. The agents are useful for manufacture of medicament for tracting GPR43-related diseases or PMN chemotaxis-related diseases or disorders such as vomiting, migraine, schizophrenia, manic depression, anxiety, dementia, neurodegenerative diseases such as

Alzheimer's disease and Parkinson's diseases and dyskinesias, such as bulbutington's disease. They are also useful for preventing, improving or correcting dysfunction or diseases e.g., pain, cancer, anorexia, bulimia, asthma, acute heart failure, hypertension, osteopoxosis, urinary tetention, angina pectoris, myocardial infarction, ulcers, allergies, stroke, and schizophrenia. The present sequence represents a GPR43 genespecific primer used in semi-quantitative RT-PCR reactions

New short interfering nucleic acid downregulates expression of the c-fos gene useful for treatment and diagnosis of diseases, e.g. cancer and inflammation.

Example 3; SEQ ID NO 40; 145pp; English.

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the human c-fos gene by RNA interference. The

cc sinka may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the sinka include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The sinka can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised (expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo dealivery of siNA, conjugates and/or complexes of siNA, and vectors that express siNA. The siNAs are used to modulate expression of the c-fos gene in cells, tissue explants or organisms of siNA, by ex vivo gene therapy), or in grafts and transplants for the creatment of a variety of conditions. They may be used for treating central nervous system lesions and injuries (e.g., Alzheimer's disease, elements of anyotrophic lateral sclerosis), various cancers other proliferative diseases (e.g., restenosis and polycystic kidney disease); inflammatory condourned diseases; varial infections (including HIV infection); autoimmune diseases; varial infections (including gene contrian), and gene mapping (e.g., of single mucleotide polymorphisms).

The present sequence represents the upper strand of a human c-fostarded double-stranded siNA, which is identical to the c-fos transcript target sequence.

Primers AAT06887-932 were used to analyse the breakpoints at chromosomal locus 8p2-21, contained in patients having prostate cancer, by microsatellite analysis and sequence taggaed sites (STS). The region contains a prostate/colon tunour suppressor gene (PTS). The primers and amplified fragments were used to screen a YAC library of prostate cancer DNA to isolate the PSTG (AAT06880), which can be used in the diagnosis and treatment of prostate and colorectal cancers. The primers AAT06919-20 amplify a 121 bp fragment from chromosomal locus BI?

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence represents a primer for exon 3 of the HLA-C gene. This sequence can be used in the method of the invention for determining the position of at least one selected species of nuclectide, in a region of interest, in a sample. The method comprises combining the sample with a reaction mixture to synthesise chain extension products indicative of the positions of the species of nuclectide in the region of interest and evaluating the products produced, characterised in that the sample, which is combined with the reaction mixture, and contains target and non-target nucleic acid polymers in natural abundance. The method can be used to detect mutations, particularly mutations of medical significance, in samples
                                                  The murine and human tub gene (AAT48550 and AAT48551 respectively) products are wild-type, expressed in the hypothalamus. The form lacking exon 5 is produced by alternative splicing. The products participate in the control of mammalian body weight. Messuring tub expression and detection of tub gene mutation are used to diagnose body weight disorders, esp. obesity, cachexia and anorexia, or related sensory and fertility defects
                                                                                                                                                                                                                                              Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  detection;

The present primer was used in the mapping of a gene encoding 2 forms of a prostate/colon tumour suppressor (P/CTS). The P/CTS gene was isolated by analysis of allelic loss in patients with prostate cancer, and was putatively located to the chromosomal location 8922-21 via microsatellite analysis and the use of sequence tagged sites (STS). Primers and probes derived from the gene can be used to screen lambda cDNA libraries for genes encoding P/CTS form 1 and 2. The P/CTS or its cDNA can be used in the diagnosis and treatment of prostate and colorectal cancers. (Updated on 25-WAR-2003 to correct PA field.) (Updated on 25-WAR-2003 to correct

This sequence represents a PCR primer for the human ACE (angiotensin converting enzyme) gene, and can be used in the method of the invention.

C determining the sequence of at least one polymorphic site in the ACE (angiotensining the sequence of at least one polymorphic site in the ACE (angiotensin converting enzyme), ACT (angiotensinogen) and/or ATI (type 1 converting enzyme), ACT (angiotensinogen) and/or ATI (type 1 angiotensin II receptor) genes, and comparing the polymorphic pattern of with that in patients with predetermined markers of Status. The method is used to assess blood pressure or electrocardiographic profile, to diagnose a cardiac condition such as (silent) myocardial infarction (MI), consequence or the certocardiographic profile, to response to treatments with ACE inhibitors, angiotensin II receptor antagonists, diuretics, alpha- or beta-adrenergic receptor antagonists, etc. It is also used to identify susceptibility to cardiovascular confises. Libraries of tucleic acids contraining polymorphic positions in the genes are used to screen for cardiovascular agents. The nucleic acids contained in the library can be is used as source of probes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Assessing cardiovascular status in humans by polymorphic analysis - of genes for angiotensin converting enzyme, angiotensinogen and angiotensin II receptor, used to diagnose predisposition to disease and to predict effect of therapy.

The specification describes a method for screening for functional polypeptides which bind a ligand. The method comprises contacting a repertoire of polypeptides with a generic ligand, and then screening selected functional polypeptides with a target ligand. The method permits the removal from a chosen repertoire of polypeptides, those which are non-functional, e.g. as a result of the introduction of frame-shift be or are incapable of binding untants or expression mutants which would be or are incapable of binding to any target ligand. The method also polypeptides which are functional, well folded and highly expressed. The polypeptides obtained can be used in diagnostic, prophylactic and therapeutic procedures. PCR primers AAX35946-48 were used to amplify a germiline V gene fragment, which was used in the construction of libraries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  PG1 gene; biallelic marker; PCR primer; PG1-related biallelic marker; cancer; prostate cancer; diagnosis; therapy; prostate specific antigen;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Primers AXX16733-X16754 are examples of primers which can be used to PCR amplify the human "tub" gene (AAX16702) exons. The invention relates to a method for identifying compounds that modulate tub protein activity, especially its interaction with proteins containing an SH2 domain. The method can be used for identifying compounds which modulate tub protein activity for use in the treatment of mammalian body weight disorders including obesity, cachexia and anorexia
                                                                                                                                                                                                                 Mouse, wild type, tubby, identification, SH2 domain, mammal, obesity, body weight disorder, cachexia, anorexia, primer, PCR, amplification, ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Identifying compounds which modulate tub protein activity - by detecting compounds which alter the interaction of tub protein with a SH2 containing peptide, used to develop agents for treating e.g. obesity,

The invention relates to a mammalian PG1 gene and protein, and a set of PG1 biallelic markers. The PG1 polynuclecide and biallelic markers are used in a hybridisation assay, a sequencing assay, or in an allelespecific amplification assay for determining the identity of a nucleotide at a PG1-related biallelic marker. The methods can be used to detect and to assess the risk of developing cancer or prostate cancer. Early-stage diagnosis of prostate cancer relies on prostate specific antigen (PSA) chapter, the effectiveness of this is limited due to its inability to discriminate between malignant and non-malignant affections of the organ. A need exists for both a reliable diagnostic procedure curative treatments of the disease. The PG1 gene can be used for detection of prostate cancer, and the risk of developing it in the future, and can also be used to determine therapies for the disease
                                                                                                       Use of a prostate cancer associated gene and biallelic markers derived

Human HPC2 cDNA exon 24 3'UTR mutation screening primer SEQ ID NO: 185 AAA60364 standard; DNA; 19 (first entry) 07-DEC-2000 AAA60364; AAA60364 RESULT 

Human, mouse, prostate cancer predisposing gene, HPC2; human chromosome 17p, gene therapy, peptide therapy, drug design, PCR primer, sequencing primer; ss.

New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves RNA encoding a cyclin or cell-cycle dependent kinase other than CDK1, PCNA and Cyclin B1.

version of the gene is found on chromosome 17p. Some alleles cause a predisposition to cancer, particularly prostate cancer. This gene and its protein can be used in peptide and gene therapy for cancer patients, as well as being useful as diagnostic tools (both for cancer sufferers and those with a predisposition to the disease) and in the production of cancer drugs
                                                                                                                                                                                                                                                                                    Ribozyme; hairpin; hammerhead; gene therapy; vasotropic; restenosis; ss.

ô 'n The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDKI, PCNA and Cyclin BI. Representative examples of ribozyme recognition sites are given in AAA82415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in Gaps ö Query Match 3.0%; Score 12.6; DB 1; Length 19; Best Local Similarity 78.9%; Pred. The invention relates to a novel method of assessing the cardiovascular status in an individual and to newly identified polymorphisms in the gratus in an individual and to newly identified polymorphisms in the gense encoding angiocensin-converting enzyme (ACB), angiotensing in the competion of angiotensing and type 1 (ATI) and type 2 (ATI), angiotensingen (ACI), renin, a didosterone synthase, endochbelin receptor type A and Deta-adenseryic creeptor type 1 (ATI) and type 2 (ATI), angiotensing the acceptor type A and 2. The method comprises determining the sequence at one or more polymorphic positions within these genes, and comparing the creeptors 1 and 2. The method comprises determining the sequence at one or more polymorphic position a population of individual sexhibiting a patent of determining the predisposition of an individual to cardiovascular disorders such as myocaxdial infarction, unstable angina, or useful for determining the predisposition of an individual to cardiovascular seatus of a patient given a predicting the likely cardiovascular status of anticivascular drugs creatment regimen comprising administration of cardiovascular drugs (e.g., ACE inhibitors) bate-adrenergic receptor antagonists (between the cardiovascular drugs and probes for detecting genetic polymorphisms or in molecular creaments of the genes comprising a polymorphic site may be used as provides a basis for predicting the outcome of atreatment regimen.

Creatments of the genes comprising a polymorphic site may be used as primary arrays for high inhoughput soreaning. The genes, and the proteins creament of they encode are useful in the acreeing of potential cardiovascular eliminates trial and error in selecting a treatment for a particular creament expense of an individual searching of potential can be evaluated to individual cardiovascular patient. It also provides the ablity to a treatment regimen Adverse results in a detecting a treatment group per each and every and adverse results of any entering the number of patientes requir
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                .

Novel phosphodiesterase and its gene for research on complex mechanism of intracellular information transfer.
                                                                                                                                                                                                                                                                                                                Sequences AAA09589-A08592 encode human phosphodiesterase 10 (PDE10) proteins AAB26853-B26856. Phosphodiesterase 10 and its gene are useful for research on the complex mechanism of intracellular information transfer. The invention includes a recombinant vector containing a PDE10 gene, and a cell transfermed with the vector. Sequences AAA09593-A09606 represent PCR primers used in the isolation of the PDE10 polynucleotide sequences of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human ACE, AGT and AT1 genes polymorphisms PCR primer SBQ ID NO: 2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; genetic polymorphism; disease diagnosis; treatment; cancer; cardiovascular system; nervous system; glaucoma; PCR primer; ss.

                                                                                                                                                            The present invention is related to methods for determining the polymorphic pattern of an individual and using the results to determine their risk of a number of diseases, including cancer, cardiovascular diseases, glaucoma and nervous system disorders such as depression and neurodegenerative diseases. In addition, the methods can be used to adetermine the effects of different types of treatment for individuals, and thus enables appropriate therapies to be prescribed. THe PCR primers shown in sequences AAC61201-C61371 were all used to demonstrate the

The present invention is concerned with a number of human single nucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to disgance susceptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, echizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Single nucleotide polymorphism; SNP; human; genetic disease; disease susceptibility; cardiovascular system; endocrine system; neurological system; forensic testing; paternity testing; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Nucleic acid selected from one of 106 genes comprising single nucleotide polymorphisms, allele-specific oligonucleotides to the genes are useful for phenotypic correlations, forensics, paternity testing, medicine and genetic analysis.
individual's susceptibility to disease, in forensic and paternity testin and in genetic mapping. In particular, the SNBs of the invention can be used to disgnose susceptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, schizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's

These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose usefullility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, echizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's

The present invention is concerned with a number of human single mucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose susceptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, echizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Single nucleotide polymorphism, SNP, human, genetic disease, disease susceptibility, cardiovascular system, endocrine system, neurological system, forensic testing; paternity testing, PCR primer, ss.

The present invention is concerned with a number of human single incleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose susceptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, schizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Single nucleotide polymorphism, SNP, human; genetic disease; disease susceptibility; cardiovascular system; endocrine system; neurological system; forensic testing; paternity testing; PCR primer; ss.

The present invention is concerned with a number of human single nucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose susceptibility to diseases of the ardiovascular, endocrine and neurological systems, such as coronary artery disease, echizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's
for phenotypic correlations, forensics, paternity testing, medicine and
genetic analysis.

Nucleic acid selected from one of 106 genes comprising single nucleotide polymorphisms, allele-specific oligonucleotides to the genes are useful for phenotypic correlations, forensics, paternity testing, medicine and genetic analysis.

Claim 8; Fig 5; 214pp; English.

The present invention is concerned with a number of human single nucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose susceptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, schizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's

Bi-directional sequencing of nucleic acid polymers for identifying pathogens or detecting mutations by using a single reaction mixture having first and second primers with different, spectroscopically-distinguishable labels.

Example 2; Col 11; 27pp; English.

The present invention describes a method for simultaneously determining the position of a nucleotide base in a target region of both strands of a denatured duplex nucleic acid polymer. The method comprises using a single set of reaction mixture that is combined with the nucleic acid polymer. The reaction mixture contains first and second oligonucleotide polymer. The reaction mixture contains first and second oligonucleotide primers, each with different, spectroscopically-distinguishable contained in the method is used to detect mutations, especially medically significant mutations, in samples derived from a human patient, animal, plant or microorganism, and for the determination of human contains first mutations, and for the determination of human also be used to detect and identify microorganisms, especially pathogenic microorganisms, in a sample, and in in situ sequencing pathogenic microorganisms, in a sample, and in in situ sequencing can then removed from a selected location on the tissue preparation and loaded onto a gel for sequence analysis. The sequencing reaction is contone of a disease condition is known, but the causative mutation is cont. The present sequence a sequencing primer for the human cont. The present sequence as sequencing primer for the human contoner. The present invention is manyle from the present invention

Novel promoters from Atlantic salmon for regulating expression of nucleotide constructs, as DNA vaccines for protecting salmon and other fish species against viral, bacterial infections.

Example 1; Page 7; 29pp; English.

The sequences given in AAC85425-28 are primers which were used in the amplification of the Salmon MHC class II bees and alpha promoters and introduced in recorded in nucleotide constructs for the purpose of regulating the expression of such constructs for the purpose of regulating the expression of such constructs. For example, the salmon MHC class II beta-promoter was constructs. For example, the salmon MHC class II beta-promoter was inserted in a plasmid vector carrying the lacz gene. The resulting plasmid vactor to promote transcription of the lacz gene. The resulting plasmid vactor different higher than the mean value +2 containing plasmid, showed an ELISA titer higher than the mean value +2 containing plasmid, showed an ELISA titer higher than the mean value +2 containing plasmid, showed an ELISA titer higher than the mean value +2 containing plasmid, showed an ELISA titer higher than the mean value +2 containing plasmid, showed an ELISA titer higher than the mean value +2 containing plasmid, showed an ELISA titer higher than the mean value +2 constructs such as these, may be used in vivo to achieve productivity constructs such as these, may be used in vivo to achieve productivity constructs such as these, may be used in vivo to achieve productivity constructs may also be useful for DNA vaccination of salmon and other constructs may also be useful for DNA vaccination of salmon and other constructs may also be useful for DNA vaccination of salmon and other in somatic tissues and may also be combined with MHC alleles for optimizing the expression and presentation of pathogenic antigens. Promoters may also be used to influence gene expression, for regulating cuttives and seroage of beta-canotenes and compounds responsible for meat cuttive and scrage of beta-canotenes and compounds responsible for meat coloring in salmonids. The promoters is active. The constitutive coloring the expression the promoter is active. The constitutive constitutive in allenged to influence promoter is active. The constitutive consti

The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme (1) which cleaves RNA encoding a cytckine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (1). (1) can have antipsoriatic, dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling, cleaves RNA encoding (1). (1) can have antipsoriatic, and segment encoding (1). (2) can have antipsoriatic, cleaves RNA encoding cytokine involved in inflammation. (1) can be used in gene therapy. (1) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, equamous or basal cell carinoma and viral or sebornheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, virreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detechment, and for treating and preventing prematurity and retinal detechment, and for treating and preventing scar.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is a PCR primer for wild-type leuk gene from E.coli, which encodes alpha-isopropylmalate synthase (IPMS). The leuk gene was used to generate a mutant alpha-IPMS, which is de-sensitised in feedback inhibition by L-leucine. The mutant alpha-IPMS is useful for the production of L-leucine, which is useful for medical treatment, as a pharmaceutical or in the chemical industry or as a growth factor useful for production of other amino acids such as 19sine. The present sequence was used to amplify the leuk gene for use in the present invention
                                                                                                                                                                                                                                                                                                                                                  Alpha-isopropylmalate synthase; enzyme; IPMS; leucine production; leuA; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Cell-cycle dependent kinase cdk4 ribozyme binding site SEQ ID NO:415.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New polypeptide with alpha-isopropylmalate synthase activity and decreased feedback inhibition of activity by L-leucine, useful for production of L-leucine for medical treatment.

The present invention relates to a number of prostate-specific sequences derived from the human PS118 gene. These can be used in the detection, monitoring and treatment of prostate diseases, particularly prostate cancer. The PS118 fragments of the invention were isolated from a prostate tissue expressed sequence tag (EST) library. The present sequence is a PCR primer used to isolate a sequence of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel PS118 polypeptide for detecting, diagnosing, staging, monitoring, prognosticating, preventing, treating, or determining predisposition of individual to diseases and conditions of prostate, e.g. prostrate cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human, mouse; HPC2; prostate cancer; neoplastic growth; cytostatic; si

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme (I) which cleaves RNA encoding a cytokine involved in tillammation, matrix metalloproteinase (WMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid molecule, antisoching, antidiabetic, antisickling, ophthalmological, cytostatic, antiseborrheic, antidiabetic, antisickling, dermatological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding cytokline involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, squamous or basal cell carionoma and viral or seborific wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing scarring such as keloid, adhesion and hypertrophic or hypertrophic burn scar.                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a human prostate cancer predisposing gene coding for an HPC2 polypeptide. The DNA and protein sequences are useful as diagnostic reagents for identifying a mutant HPC2 nucleotide sequence in a suspected mutant HPC2 allele by comparing the sequence of the suspected mutant HPC2 allele with a wild-type HPC2 sequence. The sequences are also useful for detecting an alteration in HPC2, where the alteration is associated with cancer in a human. The method involves analysing an HPC2 gene or an HPC2 gene expression product from a tissue of the human. The HPC2 gene is useful as a marker for prostate cancer and can be used in gene therapy techniques to suppress neoplastic growth of recipient cells which carry the mutant HPC2 and encoding human and mouse HPC2 and in the methods of the invention, CDNA encoding human and mouse HPC2 and
                                                                                                                                                                                                                                                                                         Novel nucleic acid sequence encoding HPC2 polypeptide, which is marker for prostate cancer, is useful in gene therapy techniques to restore HPC2 normal levels by which neoplastic growth is suppressed in recipient cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human serotonin-like G-protein coupled receptor PCR primer.

                                                                                                                                                                                                                               The present sequence is a forward primer for a novel human serotonin-like G-protein coupled receptor (5HT-like GPCR, see ABN64695). The primer was used in the RT-PCR amplification of 5HT-like GPCR mRNA in order to determine the expression profile of the receptor. 5HT-like GPCR mRNA was highly expressed in cerebellum, postcentral gyrus, dorsal root ganglia, erythrocytes, lung chronic obstructive pulmonary disease (GOPD), oesophagus, ileum chronic inflammation, benign prostatic hypertrophy (BPH) and penis. The invention provides reagents which regulate the 5HT-like GPCR and reagents which bind to 5HT-like GPCR gene products. These reagents can play a role in preventing, ameliorating or correcting dysfunctions or diseases including GOPD, a cardiovascular disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                         cancer, a urinary disorder, obssity, diabetes, a central nervous system (CNS) disorder, asthma or a haematological disorder (all claimed) in a subject. The reagent is especially an antisense oligonucleotide, ribozyme or antibody. Pharmaceutical compositions comprising the reagent, or an expression vector encoding 5HT-like GPCR, are claimed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; chromosome 1p36-35; chromosome 21q22.1; genetic analysis; genome;
                                                                                                          New G-protein coupled receptor (GPCR) polynucleotide and its encoded procein, useful for identifying modulators of GPCR activity, and in gene therapy for treating bacterial infection, cancer, acute heart failure or Parkinson's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

```
The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in method comprises: (a) clones of the genomic libraries contained in multiwell plates numbered for discrimination are mitsed in each of the multiwell plates; (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant complified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the markers is changed so that the same discrimination Nos. succeed to the maximum in the specified discrimination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified discrimination Nos. are mixed respectively in each wells of longitudinal and lateral directions; (f) the multiwell plates of the specified contains are cultured and the amplified products; (h) the clones in the multiwell plates are specified from the detected result; and (i) the clones are reconstituted as the positions on the chromosome and arrayed. The microarray is useful for gene analysis. ABM42957 to ABM43231 to ABM45634 creptesent PCR primers for human chromosome light., which are specifically claimed for use in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  PS118; prostate; marker; prostate cancer; human; sequencing; primer; ss.

The present sequence is that of a sequencing primer designed from sequencing information of a prostate-specific PS118 consensus sequence tages ABA91561). It was used in the sequencing of PS118 expressed sequence tag-specific clones (see ABA91642-S0) transcribed from human prostate tissue. PS118 polypeptides (see AAMS0809-13), polynucleotides are useful for and treating, or determining the predisposition of an individual to, hyperplasia, prostatitis, prostatic intraepithelial neoplasia, prostate cancer, tumours and metastases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Lolium perenne; perennial ryegrass; plant; cell wall; lignification; cellulase; enzyme; lignin biosynthesis; cellulose degradation; CCOAMT; caffeoyl-CoA 3-O-methyltransferase; cinnamyl alcohol dehydrogenase; CBD; caffeic acid O-methyltransferase; OMT; cinnamete-4-hydroxylase; CAH; cinnamoyl-CoA reductase; CCR; percxidase; PER; ferulate-5-hydroxylase; F5H; CELL; phenylalanine ammonia lyase; PAL; 4-coumarate:COA ligase; 4CL; ryegrass; fescue species; molecular genetic marker; PCR primer; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel nucleic acid encoding lignification and cellulase enzymes or their related enzymes useful for modifying lignin biosynthesis and cellulose degradation in plants to manipulate plant cell wall.
                              Detecting presence of target PS118 polynucleotide in test sample, useful for detecting, diagnosing, staging, monitoring, prognasticating, preventing or treating or determining predisposition to prostate disease.

```

The present invention describes a nucleic acid (1) or its fragment encoding caffeoyl-CoA 3-O-methyltransferase (CCAMT), cinnamyl alcohol dehydrogenase (CAD), caffeid acid 0-methyltransferase (OMT), cinnamate-4-hydroxylase (CRE), peroxidase (ORE), orinnamate-4-hydroxylase (CRE), peroxidase (PER), cinnamate-4-lydroxylase (CRE), peroxidase (PER), cinnamate-4-lydroxylase (FSH), phenylalanine ammonia lyse (Dolium perenne) or fescue species (TI), its nucleotide sequence information and/or single nucleotide polymorphisms is useful as a molecular genetic marker. (I) its nucleotide sequence information and/or callulose degradation in a plant to manipulate cell biosynthesis and/or callulose degradation in a plant to manipulate cell walls. (I) or its fragments are useful for isolating cDNAs and genes conciding homologous proteins from the same or other plant species, as hybridisation probes to screen libraries from the desired plant. Short segments of (I) or its fragment are useful in amplification proteocls to amplify longer nucleic acids or its fragments encoding homologous genes from DNA or RNA. (I) or its fragments are useful as molecular genetic markers for quantitative trait loci (QTL) tagging, QTL mapping, DNA ingerprinting, and in marker assisted selection, particularly in ryegrass and fescues, and in forage and turf grass improvement, e.g. cagging QTLs for herbage quality traits, dry matter digestibility, mechanical stress tolerance, disease resistance, insect pest resistance, plant stature, leaf and stem colour. AbN87220 to AbN87272 represent prometrion

Fries H, Winter A;

New nucleic acid molecule comprising a sequence of an allele of a polymorphic bovine acyl CoA-diacylglycerol transferase gene useful for testing a mammal for its predisposition for fat content of milk and for testing a mamm meat marbling.

Example 2; Page 27; 91pp; English.

The present invention describes a nucleic acid molecule (NA) (I) encoding to indicative for low fat content of milk and to low meat marbling to or indicative for low fat content of milk and to low meat marbling or (intramuscular fat content). Human DGAT is located to chromosome 8, and (intramuscular fat content). Human DGAT is located to chromosome 8, and mammal for its predisposition for fat content of milk and/or its content of predisposition for meat marbling. The method comprises analysing the gene or content of milk and/or its spredisposition for meat marbling. The method comprises analysing the gene conding DGAT for nucleotide polymorphisms (e.g. single nucleotide polymorphisms are located in the coding region of the DGAT contention polymorphisms are located in the coding region of the DGAT contelled has at the position 10433 and 10434 of the DGAT contelled has at the position 10433 and 10434 of the DGAT contelled has at the position 10433 and 10434 of the DGAT content of milk and low meat marbling. The nucleic acid molecule has at the position for low fat content of milk and low meat marbling. The nucleic acid molecule has at the position for low fat content of corresponding to position 10433 and 10434 of the DGAT corresponding to position 10433 and 10434 of the DGAT gene high correlate with a predisposition for high content of milk and high meat marbling. The nucleic acid molecule has at the position of region which is responsible for the regulation of the expression of the present content of supposition which is responsible for the regulation of the expression of the present the position of the expression of the present for supposition the exemplification of the present invention

Novel human proteins and mucleic acid encoding the proteins, useful for diagnosis, treatment and prevention of disorders involving the human protein or nucleic acid e.g. cardiac and neurological disorders.

### Example C; Page 301; 460pp; English.

The present invention describes isolated human NOVX proteins, where X is

1 to 42. ACC62236 to ACC62345 encode the human NOVX proteins given in
ARS64167 to ABR54276. NOVX sequences have antiatheroscelectic, cardiant,
hypotensive, dermatological, anorectic, immunosuppressive, cytostatic,
antidiabetic, antiinfertility, haemostatic, antiinflammatory, anti-HIV,
antidiabetic, metabolic, immunomodulator, neuroprotective, nootropic,
antidabetic, metabolic, immunomodulator, neuroprotective, nootropic,
antiparkinsonian and antilipaemic activities, and can be used in gene
therapy. NOVX proteins are useful for treating or preventing a pathology
associated with the human disease. NOVX nucleic acids, proteins and
antibodies can be used in the treatment and diagnosis of cardiomyopathy,
atheroaclerosis, hypertension, congenital heart defects, acrid estnosis,
congenital adrenal hyperplasia, prostate cancer, diabetes, metabolic
disorders, neoplasm, lymphoma, uterus cancer, fertility, haemophilia,
hypercoagulation, idiopathic thrombotycopenic purpura, graft versus host
disease, AlDS, bronchial asthma, cromm's disease, multiple sclerosis,
infectious disease, parkinson's disease, multiple sclerosis,
confernieral adrenal hyperplasia, cancer-associated cachexia, cancer,
disease, AlDS, bronchial asthma, cromm's disease, multiple sclerosis,
hyperometer, which are used in examples from the present invention.
ARS54277 represents a human trvaningen protein diven in commarison with ABK54277 represents a human trypsinogen protein given in comparison with the human NOV35b protein in the exemplification of the present invention

New short interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer, downregulates expression of mitogen-activated protein kinase genes. ... Mcswiggen J, Beigelman L, Usman N, Haeberli P, Chowrira WPI; 2003-689980/65.

(SIRN-) SIRNA THERAPEUTICS INC.

## Example 3; SEQ ID NO 414; 164pp; English.

The present invention describes a short interfering nucleic acid (siNA) chart downregulates expression of a mitogen-activated protein kinase that downregulates expression of a mitogen-activated protein kinase ((MAPK) genes by RNA interference. Also described: (1) a method for modulating expression of MAPK genes in cells, tissue explants or corganisms by introduction of siNA; (2) kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or complexes of siNA; and (4) vectors that express siNA and cells containing these vectors. MAPK siNAs care cytostatic, anorectic, antidabetic, antihiflammatory.

CC antiathritic, antipsoriatic and gastrointestinal activities. The MAPK siNAs can be used to modulate the expression of MAPK genes, in cells, tissue explants or organisms, e.g. for treating obesity; diabetes types I complish and validation; psoriasis and inflammatory bowel disease. They can also be used for drug screening; diagnosis; target disease. They can also be used for drug screening; diagnosis; target containing agene function and gene mapping (e.g. of single-nucleotide collaboration). The present sequence represents a MAPK sinA which is used in the exemplification of the present invention.

Testis specific Helix Loop Helix proteins expressed in cancers and useful for the prevention, diagnosis and treatment of prostate, bladder and ovarian tumors.

Example 1; Page 31; 62pp; English.

The present sequence is that of nested primer NP2, which was used in the amplification of gene fragments obtained from a suppression subtractive hybridization reaction using IAPC xenograft cDNA and designed to identify novel prostate and prostate cancer-specific genes. A 437 bp clone was obtained. Full-length cDNA (see AA294275) was subsequently cloned from a transcription factor that is normally expressed only in testis cDNA intervential incommentation factor that is normally expressed only in testis tissue, but is up-regulated in prostate and other types of cancer. The invention

```
This sequence represents a PCR primer used in the isolation of cDNA fragments of the PTAN (testis specific protein expressed in prostate cancer) gene. PTAN is expressed in 3 isoforms PTAN-1, 2, and 3. The PTAN gene is located on chromospene 102. PTAN is overexpressed in prostate cancer, and has a testis specific expression pattern in adult tissues. PTAN shows no homology to any known gene. PTAN can be used in methods for the diagnosis of cancer, especially prostate or breast cancer, where the normal tissue samples are prostate itssue, or breast tissue, bone tissue, lymphatic tissue, serum, blood, or urine. A vector containing the PTAN incleotide sequence, a vaccine composition targeting PTAN, PTAN, ribozymes specific for PTAN mRNA and antisense sequences, cancer, especially breast and prostate cancers. Cancer development can be inhibited by a vaccine composition targeting PTAN
                                                                                                                                        ..
0
provides diagnostic and therapeutic methods useful in the management of various cancers which express PHELIX, including prostate cancer, bladder cancer, ovarian cancer and testicular cancer

BPC-1 polypeptides and polynucleotides can be used for the detection of BPC-1 polypeptides and polynucleotides in biological samples, this is particularly useful for detecting cancers expressing BPC-1, e.g. prostate cancer or bladder cancer. Autibodies directed against BPC-1 or antisense concer or bladder cancer. Autibodies directed against BPC-1 or antisense concerned and be used in vaccines for treating or inhibiting the polymedicetides can also be used for detection, prognosis, drug screening or polymedicetides can also be used for detection, prognosis, drug screening conprises a cTDB domain which is expressed in prostate and bladder comprises a cTDB domain which is expressed in prostate and bladder carcinoma cells and which shows sequence similarity with CTB domains from their known proteins. In normal human tissues BPC-1 is only expressed in certain tissues of the brain, however, it is expressed at high levels in prostate cancer cells and bladder cancer cells. A number of synthetic colligonucleotides were used to generate BPC-1 cDNA from total cell RNA of tumour cells lines. These primars were a cDNA synthesis primer cancer cells in these primars were a cDNA synthesis primer (AAZS3041), two adaptor sequences (AAZS3047, AAZS3048). This sequence is the nested primers (NP)1 used in the amplification method.

PCR primers AAA14805-07 were used to amplify testis-specific protein Yencoded DNA. The specification describes a new method of diagnosis of specific cancer. The method comprises determining the level of testis-specific protein The method comprises determining the level of testise. TSPY mRNA or protein, and comparing these presence of elevated TSPY mRNA or protein is indicative of prostate cancer. Detection of TSPY mRNA expression or protein levels useful in the diagnosis of prostate cancer. Antisense polymucleotides complementary to the coding sequence of human TSPY are useful for treating prostate cancer by inhibiting TSPY transcription (when contacted with the TSPY mRNA). Ribozymes are also useful for treating prostate cancer by cleaving the TSPY mRNA and therefore inhibiting its translation. The vaccine is useful for the inhibiting the development of prostate cancer in a patient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Diagnosing prostate cancer by determining the level of testis-specific protein Y-encoded (TSPY) mRNA or protein and comparing these TSPY mRNA or protein levels to those of a normal tissue sample.
                                                                                                                                                                                             Prostate cancer, testis-specific protein Y-encoded mRNA, TSPY mRNA, vaccine, PCR primer, 88.
                                                                                                                                                     PCR primer for testis-specific protein Y-encoded DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Example 1; Page 20; 32pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is that of nested primer NP2, used in a secondary subtraction of gene fragments generated by a suppression subtraction of gene fragments generated by a suppression subtraction protocol that was designed to identify genes which may be differentially expressed in human prostate cancer. A partial clone, termed 22P4F11 (see AA294894), was obtained and used to identify full-length 22P4F11 cDNA (see AA294893). 22P4F11 is a testis-specific gene in normal tissues, and is also expressed in human prostate tumours, in some cases at high levels. The 22P4F11 transcript and/or protein (see AA79489) may represent a useful diagnostic marker and/or therapeutic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel testes-specific gene 22P4F11 which is expressed in human prostate cancer and is useful as a diagnostic marker and/or therapeutic target for

The human 36PlA6 gene encodes a putative transcription factor based on homology to the murine EHF gene which encodes a transcription factor which is a member of the ETS family. 36PlA6 is expressed in androgen-dependent LAPC prostate cancer xenografts and in normal prostate at approximately equal levels. The highest expression is the the prostate and colon. 36PlA6 may be involved in activating tumor-promoting genes or repressing genes that block tumorigenesis. The 36PlA6 cancer, e.g. prostate, bladder, cervical, ovarian, pancreatic and colonic cancer (all claimed). Anti-36PlA6 antibodies may be used for purifying 36PlA6 and for isolating 36PlA6 antibodies may be used for purifying 36PlA6 and for isolating 36PlA6 antibodies may be used for oligonucleotides and ribozymes can be used to inhibit the transcription and translation of the 36PlA6 gene (Claimed). The 36PlA6 polymucleotides and immunogenic fragments may also be used in cancer and polypeptides and immunogenic fragments may also be used in cancer Sequence 20 BP; 3 A; 5 C; 10 G; 2 T; 0 U; 0 Other; (claimed) vaccines

The present invention describes human prostate specific protein 30P3CB, which is over-expressed in prostate cancer cells. 30P3CB has cytostatic cativity and can be used in vaccines and gene therapy. Methods for detecting the levels of 30P3CB protein or mRNA in prostate tissue, bone tissue, lymphatic tissue, serum, blood or semen are used for diagnoshing the presence of cancer in an individual or disregulated cell growth e.g. hyperplasia. The cancers which are detected or diagnosed are of the bladder, pancreas, colon, brain, bone, lung, kidney or prostate by using test samples of serum, blood or urine or tissues of the bladder, pancreas, colon, brain, bone, lung, kidney and prostate applicable of sequences can be used for treating cancers expressing colymucleotide sequences can be used for treating cancers expressing colymucleotide sequences can be used for treating cancers expressing cused in vaccines to inhibit the development of cancer. Anti-30P3CB are monoclonal antibodies bind to 30P3CB and disrupt interactions between condense and other proteins e.g. receptors for which 30P3CB is a ligand. 30P3CB may be a growth factor or other molecule involved in tumour growth cancer promoting activities of 30P3CB. The assays are invasion or other cancer promoting activities of 30P3CB. The assays are used for detecting, staging and monitoring prostate cancer. The 30P3CB cused for detecting provide a more specific assay than the serum prostate concer and provide a more specific assay than the serum prostate concer and provide a more specific assay than the serum prostent energy present appreaent sequence represents a 30P3CB conserted primer, which is used in the exemplification of the present

Novel 24P4C12 polypeptides and polynucleotides, used in the diagnosis and treatment of cancer, especially prostate cancer.
                                                                                                                                                                                                                                                                                       The present invention describes a prostate tumour associated gene, designated 24P4C12, and its encoded protein. 24P4C12 has anticancer and cytostatic activity, and can be used in vaccine production and in gene therapy. A pharmaceutical composition or vaccine comprising 24P4C12 can be used to treat a patient with cancer, especially prostate cancer, the vaccine can also be used to inhibit the development or progression of cancer. The polypeptides and polynucleotides can be used to disgnose cancers, especially prostate cancer. A transgenic animal comprising 24P4C12 can be used for the development and screening of therapeutic reagents. The polypeptide is a transmembrane protein which is expressed specifically in prostate cancer, allowing the development of more specific anticancer therapies and diagnostic assays

Detecting cancers, particularly of prostate and colon, from overexpression of SGP28 protein, also methods for treating these cancers e.g. by vaccination with the protein.

Example 1; Page 59; 102pp; English.

The present invention relates to methods and compositions for the diagnosis and therapy of prostate cancer which utilise human SGP28 (specific granule protein 28) gene and proteins. The method involves ceptering cancers, particularly of prostate and colon, from cancers, particularly of prostate and colon, from coveragesion of SGP28 protein. The expression of SGP28, which is an coveracelular protein is restricted to the prostate and ovary, and is markedly up-regulated in prostate tumours. SGP28 sequence is used for diagnosis (including in vivo inaging), staging, monitoring and prognosis of prostatic and colon cancer, and for assisting selection of therapy. Composition or vaccine that contains a vector expressing an antibody specific for SGP28 protein, nucleic acid encoding SGP28 protein or the specific antibody opionally conjugated to toxin or therapeutic agent. SGP28 gene product is also used as source of therapeutic antisense or ribosyme agents, as primers/probes for diagnosis or prognosis, to identify compounds that inhibit calcium entry into prostatic cells, for recombinant production of SGP28 peptides and for isolating related sequences. SGP28 protein and its

Wed Apr 21 12:58:21 2004

fragments are used to raise specific antibodies (Ab) and to identify specific binding agents (potentially useful as therapeutic and diagnostic agents) and also potential anticancer agents. The present sequence is a nested primer 2 (NP2) used to amplify gene fragments resulting from SSH (suppression subtractive hybridisation) reaction. This sequence is used in the SSH isolation of cDNA fragment of human SGP28 gene 8888888888

Detecting presence of cancer expressing 36P6D5 protein in individual by comparing protein level in test sample to normal sample, where elevated level of protein in test sample indicates presence of cancer.

Example 1; Page 70; 113pp; English.

The present invention relates to a gene and its encoded secreted tumour antigen, termed 36P6D5. These sequences are used for the diagnosis and treatment of various cancers which express 36P6D5, such as cancers of the kidney, bladder, ovary, breast, pancreas, colon and lungs. In normal individuals 36P6D5 protein, is predominantly expressed in pancreas, with comparising immunogenic protein of 36P6D5 is useful for inhibiting the development of prostate or colon cancer. Pharmaceutical composition comprising 36P6D5 protein is useful for diagnosis and/or programs of prostate cancer and other cancers, for modulating or inhibiting the expression of 36P6D5 genes and/or translation of the 36P6D5 transcripts, and as therapeutic agents. The present sequence is a nested primer (NP)2 used to amplify gene fragments resulting from SSH (suppression subtractive hybridisation) reaction. This sequence is used in the SSH isolation of cDNA fragment of human 36P6D5 gene

New PC-LECTIN polynucleotide encoding a transmembrane antigen over expressed in human prostate cancer, useful for the prognosis, diagnosis and treatment of prostate cancer.

Example 1; Page 59; 116pp; English.

The invention relates to a novel human C-type lectin transmembrane cantigen, PC-LECTIN (AAB73309) and cDNA encoding it (AAF76004). The antigen, PC-LECTIN (AAB73309) and cDNA encoding it (AAF76004). The capression of the human PC-LECTIN gene is normally restricted to the captesion is highly overexpressed in prostate cancer. PC-LECTIN therefore independent prostate tumours, and expression is therefore likely conditional dependent prostate tumours compared with androgen-independent prostate tumours. And expression is therefore likely cropsession is the presence of androgen. Human PC-LECTIN therefore cropsession adiagnostic and therapeutic target for prostate cancer. Cropsession androgen-dependent prostate cancer. Human PC-LECTIN exhibits concilorly to hamster layilin (44.9% identity over a 265 residue overlap), concilorly in a key functional domain proposed for the layilin concilor protein. Human PC-LECTIN applicational domain proposed for the layilin concilor protein. Human PC-LECTIN antisense nucleotide, a PC-LECTIN concilor-treating a patient with a cancer, concilor-targetted ribozyme, or an anti-PC-LECTIN antibody may be used to prepare a composition for treating a patient with a cancer, colon, pancreatic, testicular, cervical or ovarian cancers that express colon, pancreatic, testicular, cervical or ovarian cancers that cxpress colon, pancreatic, testicular, cervical or ovarian cancers for colon, pancreatic, testicular, cervical or ovarian cancers for colon, pancreatic, testicular, each also useful for diagnosing the presence of cancer. PC-LECTIN antibodies and nucleotides are useful in the antibodies may also be used as drug targetting agents. The PC-LECTIN antibodies may also be used as drug targetting agents. The PC-LECTIN concludes and proteins may additionally be used in the isolation of human concern sequence represents a pCR-LECTIN function or expression.

Novel gene designated PHOR-1, a G-protein-coupled receptor up-regulated in prostate cancer, useful as diagnostic marker and therapeutic target for cancers of prostate, kidney, uterus.

Example 1; Page 59; 139pp; English.

The invention relates to a novel G-protein-coupled receptor up-regulated in prostate cancer, termed PHOR-1. The encoding cDNA is contained in plantal designated plo1019All deposited with ATC as Accession No.PTA-112. PHOR-1 polypepides and polymuclectides are useful for diagnosing the presence of cancer, especially prostate, kidney, uterine, cervical, cancer where a comment is a comparing the level of the protein or mRNA expression in test and comparing the level of the protein or mRNA compositions comprising PHOR-1 is useful for treating cancer. PHOR-1 proteins are useful for identifying ligands and other of generating antibodies which are useful in diagnostic, prognostic and for generating methodologies and for the treatment of prostate cancer. Cell insign methodologies and for the treatment of prostate cancer. Cell interactions mediated by PHOR-1 (The present sequence represents a primer useful in isolation of the PHOR-1 (prostate homologue of olfactory receptor

An isolated 83P5G4-related protein useful as a diagnostic and/or therapeutic agent in multiple cancers such as prostate, bladder and bone

Example 1; Page 55; 112pp; English.

The nucleic acid sequences represent the 83P5G4 gene and the primers and adaptors used to amplify 83P5G4 DNA. 83P5G4 exhibits prostate specific expression in normal adult tissue, but it is also aberrantly expressed in many cancers including tumours of the prostate, testis, bladder, kidney, brain, bone, cervix, uterus, ovary, breast, pancreas, stomach, rectum, liver, colon and lung The 83P5G4 polynucleotide, its related protein and also peptide fragments of the protein are therefore useful for diagnosing and treating cancer. A vector comprising a polynucleotide which encodes a single chain monoclonal antibody, that immunospecifically binds to an single chain monoclonal antibody, that immunospecifically binds to an plynucleotide having the 83P5G4 capable of cleaving; a polynucleotide having the 83P5G4 capable of cleaving; a persention of a composition for treating a patient with a cancer that expresses 83P5G4. The sequences can be used in diagnostic methods to monitor the level of 83P5G4 gene products in serum, blood, urine and to thereby detect the presence of cancerous cells

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          BXBX8X44454
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequences AAS42193-AAS42208 represent the 103P2D6 gene and the primers and adaptors used to amplify 103P2D6 DNA. 103P2D6 is not expressed in normal adult tissue but is aberrantly expressed in some foretal tissues contain and also protects, testis, bladder, bone, cervix, ovary, breast, pancreas, colon and lung. The 103P2D6 DOPE, comprising a polymucleotide protein and also peptide fragments of the protein are therefore useful for diagnosing and treating cancer. A vector comprising a polymucleotide which encodes a single chain monoclonal antibody, that immunospecifically binds to an 103P2D6-related protein, antibody, that immunospecifically binds to an 103P2D6-related protein, and a ribozyme capable of cleaving a polymucleotide having the 103P2D6 coding sequence, are both useful in the preparation of a composition for treating a patient with a cancer that expresses 103P2D6. The sequences can be used in diagnostic methods to monitor the level of 103P2D6 gene products in serum, blood, urine and tissue and to thereby detect the presence of cancerous cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human, cytostatic, antiproliferative, vaccine, gene therapy,
six transmembrane epithelial antigen of the prostate-1; STEAP-1; cancer;

the present sequence is nested primer (NP2) which is used to isolate the human six transmembrane epithelial antigen of the prostate (STEAP) cDNA fragment generated from suppression subtractive hybridisation (SSH).

STEAP gene is used in gene therapy. Inhibiting the development or progression of a cancer (eg. prostate, colon, bladder, lung, ovarian and pancreatic) expressing STEAP or inhibiting powth or killing cells capressing STEAP, or inhibiting the development or composition to the patient. Treating a patient with a cancer that expresses STEAP, or inhibiting growth or killing cells expressing STEAP, comprises administering to the patient of the patient of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New STEAP (six transmembrane epithelial antigen of the prostate) proteins, expressed in human cancers, useful for detecting and treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       84P2A9; PCR primer; DNA adaptor; prostate; testis; tissue; cancer; ss; leukaemia; tunour; kidney; brain; bone; skin; ovary; breast; pancreas; colon; lung; cytostatic; gene therapy; antibody therapy; ribozyme; single chain monoclonal antibody; serum; blood; urine.

Challita-Eid PM, Levin E, Mitchell SC;

The nucleic acid sequences represent the 84P2A9 gene and the primers and adaptors used to amplify 84P2A9 DNA. 84P2A9 exhibits prostate and testis specific expression in normal adult tissue, but it is also aberrantly expressed in many cancers including leukaemia and tumours of the prostate, testis, kidney, brain, bone, skin, ovary, breast, pancreas, colon and lung. The 84P2A9 polymuclecide, its related protein and also peptide fragments of the protein are therefore useful for diagnosing and treating cancer. A vector comprising a polymuclectide which encodes a single chain monoclonal antibody, that immunospecifically binds to an 84P2A9-related protein, and a ribozyme capable of cleaving a polymuclectide having the 84P2A9 coding sequence, are both useful in the preparation of a composition for treating a patient with a cancer that expresses 84P2A9. The sequences can be used in diagnostic methods to monitor the level of 84P2A9 gene products in serum, blood, urine and tissue and to thereby detect the presence of cancerous cells New 84P2A9 gene and its encoded protein, useful for diagnosing and treating cancer, e.g. leukemia and cancer of the prostate, testis, kidney, brain or bone, or for eliciting an immune response. Novel isolated 55P4H4-related protein encoded by a gene over-expressed in multiple cancers, useful as a diagnostic and/or therapeutic agent for cancer, preferably prostate cancer.

Example 1; Page 54; 160pp; English

This invention relates to an isolated 55P4H4-related protein encoded by a conservation relates to an isolated 55P4H4 related protein, providing the protein comprises of at least one T cell or B cell epitope. The immune system cell is a B cell which generates antibodies that comprises of at least one T cell or B cell epitope. The immune system cell is a B cell which generates antibodies that comprises of autologous cell that expresses the 55P4H4 controlled which kills an autologous cell that expresses the 55P4H4 controlled which kills an autologous cell that expresses the 55P4H4 controlled which is considered useful for monitoring the presence of facilitate the cytotoxic activity of a cytotoxic T lymphocyte. A method is mentioned which is considered useful for monitoring the presence of cancer in an individual, where the presence of elevated 55P4H4 mRNA or protein expression in the test sample relative to the normal tissue concurs in a prostate, kidney, testis, lung cervix, bone, bladder, brain or ovary tissue. The protein is useful in diagnostic assays that examine contituons associated with disregulated cell growth such as cancer and is also useful in foremaic analysis of tissues of unknown origin, to treat a pathological condition characterized by the overexpression of 55P4H4, for assessing the status of 55P4H4 gene products in normal versus cancer use cissues and to assess the presence of perturbations in specific regions of the 55P4H4 gene. This sequence represents nested primer (NP) 2 used curing the method highlighted in the examples

(UROG-) UROGENESYS INC.

The invention relates to a polynucleotide, designated 3473D7, encoding 3473D7.related protein, comprising a sequence of 2198 nucleotides fully defined in the specification. The presence of elevated 3473D7 mRNA or protein expression indicates the presence of cancer occurring in protein expression indicates the presence of cancer occurring in breast, pancreatic, ridmey, brain, bone, cervical, uterine, ovarian, breast, pancreatic, stomach, colon, rectal leukocytes, liver, and lung protein, an antisense polynucleotide complementary to 3473D7 related polynucleotide, or a ribozyme capable of cleaving the 34P3D7 polynucleotide, are aribozyme capable of cleaving the 34P3D7 polynucleotide is useful for inhibiting the development of a cancer expressing 34P3D7 in a patient. The present sequence was used in an example demonstrating suppression subbractive hybridisation (SSH)-generated isolation of a cDNA fragment of the 34P3D7 gene New gene designated 34P3D7, encoding a tissue-specific protein highly expressed in prostate cancer, for use as diagnostic and/or therapeutic target for cancers, and for eliciting an immune response. New composition comprising a substance that modulates the status of 125P5C8 gene or a molecule that is modulated by 125P5C8, useful for treating or preventing cancer that expresses or over expresses 125P5C8.

Example 1; Page 68; 274pp; English

The present invention relates to compositions comprising a substance that modulates the status of 125P5C8 or a molecule that is modulated by 125P5C8. The status of a cell that expresses 125P5C8 is modulated by composition is useful for treating cancer, particularly prostate, bladder, kidney, colon, ovary or breast cancer. The 125P5C8 protein amount of a nucleotide sequence encoding the protein is useful for immunising a mammal against cancer. The present sequence is a PCR primer shown in the exemplification of the invention . Match 3.0%; Score 12.6; DB 1; Length 20; Local Similarity 78.9%; Pred. Monitoring 103P3E8 gene products in sample from patient (suspected of) having cancer, useful for diagnosing, managing or treating cancers, e.g. prostate cancer, comprises determining presence of aberrant 103P3E8 gene 

Example 1, Page 55, 128pp; English.

Sequences AAS95810-AAS95820 represent the 1039388 gene and the primers and adaptors used to amplify 1039388 DNA. 1039388 exhibits tissue specific expression in normal adult tissue, but it is also aberrantly expressed in many cancers including tumours of the prostate, bladder, kidney, colon, lung, breast, rectum and stomach. The 103938 polynucleotide, its related protein and also peptide fragments of the protein are therefore useful for diagnosing and treating cancer. A vector comprising a polynucleotide which encodes a single chain monoclonal antibody, that immunospecifically binds to an 1039388-related protein, and a ribozyme capable of cleaving a polynucleotide having the 1039388 coding sequence, are both useful in the preparation of a composition for treating a patient with a cancer that expresses 1039388. The sequences can be used in diagnostic methods to monitor the level of 1039388 gene products in serum, blood, urine and tissue and to thereby detect the

presence of cancerous cells ន្តដូន

New isolated 98P7C3-related homeodomain protein highly expressed in various cancers, useful in cancer vaccines and for generating immune response directed to 98P7C3 in mammal.

Example 1; Page 53; 155pp; English.

The invention relates to an isolated 98P7C3-related protein which is a homeodomain protein highly expressed in various cancers. Also include are nomeodomain protein highly expressed in various cancers. Also include are polymuclectides encoding the protein or proteins 078 identical to 98P7C3, a pharmaceutical composition comprising the polymuclectides (including an expression vector comprising the yestor, an anti-98P7C3 antibody, an non-homen transformed with the vector, an anti-98P7C3 antibody, an non-homen transformed with the vector, an anti-98P7C3 antibody, an non-homen transformed with the vector, an anti-98P7C3 antibody, an non-homen transformed with the vector, an anti-98P7C3 antibody of the 98P7C3 protein or polymuclectides in a biological sample, monitoring the presence of cancer in an individual by detecting an elevated level of the 98P7C3 protein or polymuclectides and a pharmaceutical composition comprising a modulator of 98P7C3. 98P7C3 protein, or T call R cell composition mammal) to a 98P7C3 protein, upon contact with a cytotoxic T call (CTL) the immunogen may be a nucleic acid encoding the protein or epitope. The antibody is useful for delivering a cytotoxic agent to a cell that expresses 98P7C3, by conjugating the conjugating the conjugate. The modulator is useful for the antibody-agent conjugate. The modulator is useful for treating a patient with a cancer

that expresses 98P7C3 (e.g. prostate cancer, bladder cancer, kidney cancer, lung cancer, breast cancer, uterine cancer, cervical cancer, eccal cancer and colon cancer), by administering to the patient a vector that comprises the modulator, such that the vector delivers a single chain monoclonal antibody coding sequence to the cancer cells and the encoded single chain antibody is expressed intracellularly in it. The gene for 98P7C3 is located on human chromosome 4q11-q12. The present sequence is oligonucleotide adapter or PCR primer used to isolate a CDNA sequence. hybridisation, SSH

Monitoring 83P2H3 gene products for monitoring the presence of cancer i a subject, comprises determining the status of 83P2H3 gene products in tissue sample from the subject and comparing it to a normal sample. 

Example 1; Page 76; 270pp; English.

The invention relates to monitoring 83P2H3 (a calcium transport protein whose gene is located on chromosome 7q34) gene products in a biological sample from an patient who has or is suspected of having cancer cancer; captured of having cancer cancer; captured in a biological sample from an an especially prostate cancer; captured in a tissue sample from an comparing the status to the status of 83P2H3 gene products and (b) comparing the status to the status of 83P2H3 gene products in a normal sample. Also included are modulators of 83P2H3 gene function or status, generating antibodies/immune response against 83P2H3 (or related protein Carrezzil whose gene is located on chromosome carreage protein carreage and elevant sample from an eukocyte antigen) binding peptides derived from the protein, delivering a cytotoxic agent to a cell captured from the protein delivering an antigen-binding region of the antibody, a recombinant protein cantant that produces the recombinant protein, a non-human transgenic animal that produces the recombinant protein, a

tight chains of the anti-appeals the variable domains of the heavy and monoclonal antibody that comprises the variable domains of the heavy and inght chains of the anti-appeals antibody, a vector comprising a polynucleotide that encodes the monoclonal antibody and inducing an immune response to a 8322H3 protein, by providing a 83P2H3-related protein that comprises a T cell or B cell, respectively. The method contacting the protein that comprises a T cell or B cell, respectively. The method is useful for monitoring 83P2H3 gene products in a biological sample for monitoring the growth of cancer in an individual. The modulator is useful for inhibiting the growth of cancer cells that express 83P2H3, for treating an immune response against 83P2H3, and for detecting the cancer that expresses 83P2H3. The immunological methods are useful for generating an immune response against 83P2H3, and for detecting the presence of 83P2H3. The immunological methods are useful for generating an immune response against 83P2H3, and for detecting the presence of 83P2H3. The immunological methodologies and treatment, to detect and quantify 83P2H3 and mutant control of presence of antibodies and treatment, to detect and quantify 83P2H3 and mutant control is sample from a patient mimic the 83P2H3-related protein, for generating anti-italic didotypic antibodies that mimic the 83P2H3 crelated protein. The present sequence is a PCR primer used in the isolation of cDNA encoding 83P2H3 or its 8888888888888888888888888888888

Example 1; Page 95; 309pp; English.

The invention relates to a new composition comprising a substance that modulates the status of a zinc transporter protein, designated as 108P5H8, or a molecule that is modulated by 108P5H8. The composition is

useful in diagnosing, preventing, prognosticating or treating patients with cancer that expresses 108P5H8, such as breast, colon, ovarian or lung cancer. The 108P5H8 gene or its fragment can be used to elicit humoral or cellular immune response. The antibodises are useful in active or passive immunisation. The 108P5H8 polymucleotides are useful as probes and primers for the amplification or detection of 108P5H8 genes, as coding sequences for directing the expression of 108P5H8 polypeptides, or as tools for modulating or inhibiting the expression of 108P5H8 genes. The polymucleotides of the invention can be used to treat disorders by gene therapy. This polymucleotide sequence represents a zinc transporter protein 108P5H8 related PCR primer of the invention

generating and characterising domain-specific antibodies, for identifying agents or cellular factors that bind to 121P2A3 or a particular structure domain, and in various therapeutic and diagnostic contexts, including cancer vaccines. The antibodies or I cells reactive with the product are useful in passive or active immunisation, and in imaging methodologies for the management of cancer. The present sequence represents an nested PCR primer used in the invention to amplify gene fragments resulting from suppression subtractive hybridisation (SSH) reactions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention describes a new composition comprising a substance that modulates the status of 158P3D2 or a molecule that is modulated by 158P3D2, where the status of a cell that expresses 158P3D2 is modulated. The composition is useful for treating cancer. This sequence represents novel protein 158P3D2 associated primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New composition comprising a substance that modulates the status of 158P3D2 or a molecule that is modulated by 158P3D2, useful for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The invention relates to a novel composition comprising a substance that modulates the status of a 151934 protein (e.g. 151934 variant 1-11; or a molecule that is modulated by the 151934 protein, where the status of a cell that expresses the 151934 protein is modulated. The novel compositions, or the 151934 protein and genes, are useful for eliciting a humoural or cellular immune response. The 151934 genes and proteins are also useful for diagnosing, prognosing preventing or treating cancer, e.g. adenocarcinoma, bladder cancer, colorectal cancer, lung or bronchial cancer, breast cancer or carcinoma. This polynucleotide sequence represents a 1519304 related primer of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New 151P3D4 proteins and genes, useful for eliciting a humoral or cellular immune response, or for diagnosing, prognosing, preventing or treating cancer, e.g. adenocarcinoma, bladder cancer, lung, breast cancer

The invention describes a composition comprising a substance that modulates the status of a protein (1) of 340 or 283 amino acids, or of any of the 15 sequences of 259 amino acids, given in the specification, or a molecule that is modulated by the protein, where the status of the cell that expresses the protein is modulated. The compositions, proteins, polymucleotides and methods are useful for generating and electring cancer. The STEAP-1-related proteins are useful for generating cancer vaccines. The polymucleotides are useful as tools for delineating, with greater precision, cytogenetic abnormalities in the chromosomal region that encodes STEAP-1 that may contribute to the malignant phenotype. This sequence represents a primer used to analyse human six transmembrane epithelial antigen of the prostate or STEAP-1 CDNA's

status of

STEAP-1-related protein, useful for treating and detecting cancer.

The invention relates to a novel composition comprising a substance that modulates the status of a 162P1E6 protein. The protein comprises one of a 162P1E6 protein. The protein comprises one of a sequences of 70 - 146 amino acids, given in the specification, or a molecule that is modulated by the protein, where the status of a cell that expresses the protein is modulated. An antibody to the 162P1E6 protein is used to deliver a cytotoxic agent or a diagnostic agent to a cell that expresses the 162P1E6 protein. The composition is used to inhibit the growth of cancer cells or generate an immune response. The composition is used for detecting the presence of a 162P1E6 related protein or a 162P1E6-related polymucleotide in a sample. The 162P1E6 proteins and polymucleotides encoding them are useful for diagnosing, proteins and polymucleotides encoding them are useful for diagnosing, prostate cancer, kidney cancer, lung cancer, or breast cancer. They can also be used for eliciting a humoral or cellular immune response. The antibodies or T cells reactive with 162P1E6 are useful for active or passive immunisation. Transgenic animals are useful for developing and screening of useful reagents. The polymucleotide and polympetide sequences of the invention can also be used to treat disorders by being used in a vaccine or in gene therapy. This polymucleotide sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

New composition comprising a substance that modulates the structure of proteins and polynucleotides, useful for therapeutic, prognostic and diagnostic reagents for eliciting cellular or humoral immune response in cancer patients.

Example 1; Page 72; 1021pp; English.

The present invention relates to novel human cancer-related genes and proteins (AB278120-AB278166 and ABR01789-ABR01861). The genes and proteins are useful for eliciting a humoral or cellular immune response. The genes are useful as probes and primers for the amplification and/or detection of genes, mRNAs or their fragments, as reagents for the adjances and/or prognosis of cancer, as coding sequences capable of directing the expression of the protein, as tools for modulating or inhibiting the expression of genes and/or translation of transcripts, and as therapeutic agents. The proteins and peptides are useful as therapeutic, prognostic and diagnostic reagents for cancer. The present sequence is a primer, used in an example from the invention

Challita-Bid PM;

New pharmaceutical composition for diagnosing, prognosing, preventing or treating cancer, comprises a substance that modulates a nucleic acid sequence, e.g. 105P1B7, 152P1A2B or 156P3A6, or a molecule modulated by the nucleic acid.

Example 1, Page 34; 72pp; English.

The present invention relates to a pharmaceutical composition comprising a substance that modulates the status of a cancer associated nucleic acid sequence such as given in the specification (see ABZ20564-ABZ20575) or a molecule that is modulated by the above nucleic acid sequence, where the status of a cell that expresses the nucleic acid sequence; smodulated. The composition is useful in diagnosing, prognosing, preventing and/or treating cancer. The nucleic acid sequence may be used in monitoring of abourmalisties, in generating and characterising domain-specific antibodies, for identifying agents or cellular factors that bind to a protein, and in therapeutic and diagnostic contexts, such as diagnostic assays, cancer vaccines, and methods of preparing vaccines. The present sequence is a primer used to identify the cancer associated coding sequences suitable to be modulated in the method of the invention

New 184PIE2 polynuclectide encoding a 184PIE2 protein, useful for diagnosing, prognosing, preventing or treating cancer, in eliciting an immune response, and in chromosome mapping.

Example 1; Page 69; 394pp; English.

The invention comprises the amino acid and coding sequence of a 184PIE2 protein. The DNA and protein sequences of the invention are useful for diagnosing, prognosing, preventing and/or treating cancer. The 184PIE2 DNA and protein sequences may also be used to elicit a humoral or a cellular immune response in patients and in monitoring genetic abonormalities. Antibodies raised against the 184PIE2 proteins may be used in active or passive immunisation. The present DNA sequence is used in the exemplification of the invention

```
This invention relates to a novel gene designated 205P1B5, and the encoded protein, which is aberrantly expressed in prostate cancer. Specifically, it refers to the two variants of 205P1B5 mapped to chromosome 821-8912, namely 205P1B4v1 and 205P1B5v2 and fragments thereof that serve as useful diagnostic, prophylactic, prognostic and/ or therapeutic targets for prostate and other types of cancers. The present invention describes methods for the isolation of 205P1B5, for generating an immune response and for generating transgenic or knock out animals for the development and screening of therapeutically useful reagents. Purthermore, it refers to identifying proteins, small molecules or other agents that interact with 205P1B5, and can be used to identify pathways activated by 205P1B5. Accordingly, these are cytostatic and immunogenic compositions that are useful for the development of cancer vaccines. This suppressive subtractive hybridisation (SSH) to isolate the 205P1B5 CDNA fragment of the invention.
                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    205P1B5; prostate cancer; immune response; transgenic; knock out animal; cytostatic; immunogenic; vaccine; ss; SSH; suppressive subtractive hybridisation; PCR; primer; NP2.

The present invention describes a composition (I) comprising a substance that modulates the status of 121PIFI (gene and encoded protein), or a molecule that is modulated by 121PIFI (gene and encoded protein), or a molecule that is modulated. The human 121PIFI gene maps to chromosome 4q. (I) has cytostatic activity, and can be used in gene therapy, and in vacines. The composition (I) can be used for diagnosing, preventing, prognosticating or treating patients with cancer that expresses 121PIFI, such as breast, colon, ovarian or lung cancer. The 121PIFI gene or its cragment can be used to alicit a humoral or cellular immune response. If IPIFI antibodies can be used in active or passive immunisation. 121PIFI polynoclecides are useful as probes and primers for the amplification or detection of 121PIFI pelpeptides, or as coding sequences for the amplification or inhibiting the expression of 121PIFI genes. The present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ਨੇ
                                                                                                                                                                                                                                                                                                                                                                                                                      This invention relates to a novel composition which comprises a substance that modulates the status of a novel protein (16122108) and its variants having a sequence of 875 amino acids provided in the specification. The protein of the invention is over-expressed in certain cancers. The compounds of the invention may have cytostatic activity and the sequence of the lelpzing protein, and the gene which encodes it, may be useful for gene therapy or the development of a vaccine. The composition and methods of the invention are useful in diagnosing, preventing and retacting acucer. The present sequence is that of PCR primer which was used for amplification of a region of the gene encoding the human lelpziloB protein during the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                            A composition for diagnosing, preventing and treating cancer (e.g. prostatic, renal or uterine cancer) comprises 161P2F10B polynucleotides and polypeptides.
                                                                                                                                                                                                                                                          Jakobovits A, Raitano AB, Faris M, Hubert RS, Ge W, Morrison KJM;

```

This invention relates to novel composition comprising a substance that modulates the status of a 433 residue protein, given in the specification with the DNA sequence encoding it, or a molecule that is modulated by the protein. The novel protein 193PEIB exhibits tissue specific expression in normal adult tissue and is aberrantly expressed in cartain cancers. Compositions which modulate the 193PIBIB protein may have cytostatic activity and the DNA sequence which encodes protein 193PIBIB may be useful in gene therapy. The composition of the invention may be useful por the treatment of cancer. The present sequence is that of an RT-PCR primer which was used for the amplification of human 193PIBIB gene DNA during the exemplification of the invention.

The invention relates to a novel method for obtaining typing information about several variable sites within target nucleic acid, or typing one or mote nucleic acid molecules. The methods of the invention are useful for typing one or more nucleic acid molecules containing two or more variable sites, preferably nucleic acid molecules containing three or more variable sites are typed, where three or more primer exension reactions or performed. The method is also useful for diagnosis of pathological conditions characterized by the presence of specific nucleic acid molecule(s). The methods are particularly suited for identifying microbial species or their subtypes, and in typing procedures e.g. typing of polymorphisms, tissue typing or in clinical applications. The sequence connected primer used in the invention to amplify the single nucleotide polymorphism (SNP) Eu6 from the angiotensin converting enzyme (ACE) gene. The primer binds to the template with its 3, end 5 cucleotides from the SNP position
                                                                                                                                                                                                                                                                                                                                                                                                        ö

The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves relA mRNA at the nucleotide base position indicated in the DE line. The relA gene product is a subunit of the transcriptional regulator NF-kappaB and is implicated specifically in the induction of inflammatory responses. Regions of the mRNA that do not form secondary folding structures and that contain protential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes are designed to cleave the target sequences and thereby inhibit relA expression, making them potentially useful for treating rheumatoid arthritis, restenosis and asthma as well as for increasing tolerance to transplanted tissues. The potential in immunosuppressive properties of a ribozyme that cleaves relA mRNA means that uses are limited to local delivery, acute indications or ex vivo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Arthritic condition, graft tolerance; immune response; target; cleavage; hammerhead ribozyme; hairpin ribozyme; human; rebbit; mouse; collagenase; stromelysin; synovial membrane; joint; arthritis; osteoarthritis; rheumatoid arthritis; autoimmune disease; allergy; inflammation;

Hammerhead ribozyme; cholesterol ester transfer protein; mRNA cleavage;

```
The present invention describes a novel enzymatic nucleic acid (ENA) having a hammerhead motif (HM) comprising; (i) at least 5 ribose residues 7 (ii) a 2-C-allyl modification at position 4 of the ENA, (iii) at least to 7 (iii) at least 5 ribose residues 5 (iii) at least 5 ribose residues 6 (iv) a 3'-end modification. The ENA's can inhibit collagenase and stromelysin production in the synovial membrane of joints for the treatment or prevention of arthritis, particularly osteoarthritis or rheumatoid arthritis. The ENA's can also be used to treat antigen presenting cells of a donor to induce tolerance in a recipient to an alloantigen of a donor. They can also be used for enhancing graft tolerance or for treating autoimmune disease, and for treating allergies and other inflammatory conditions. The ENA's can also be used in diagnosis. Ribozyme therapy impacts on the expression of a tromelysin without introducing the non-specific effects upon gene expression which accompany treatment with retinoids and dexamethasone. The concentration of ribozyme required to affect a therapeutic treatment is lower than that required of antisense molecules, and is highly present in the present sequence is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Enzymatic nucleic acid molecules having a hammer-head motif - used for
the treatment of arthritis, induction of graft tolerance or treatment of
auto-immune diseases.

AAT49608-T49863 represent target sequences for the human cholesterol ester transfer protein (GETP) hammerhead (HH) ribozymes (see AAT49881-CT50137). GETP is a 74 kD glycoprotein that facilitates neutral lipid transfer between plasma lipoproteins. The numbering of the targets refers to the position of the cleavage site in full length GETP. The ribozyme Dinds to Simmediately upstream ther side of this site, provided the sequence UH is immediately upstream. The ribozymes are able to cleave mRNA from the gene encoding GETP, thereby blocking synthesis and/or expression of the mRNA. By inhibiting CETP, the reverse cholesterol transport (RCT) pathway can be inhibited (or eliminated) thereby HDL), prolonging HDL half life, and therefore increasing HDL levels. The ribozymes can be used to treat conditions associated with abnormal levels of CETP, specifically familial hyperbelaipoproteinaemia, atherosclerosis, peripheral vascular disease, hyperbelaipoproteinaemia, hypozaphalipoproteinaemia, dyslipidaemia, associated with abnormal levels of CETP, specifically familial hyperbelaipoproteinaemia, hypozaphalipoproteinaemia, dyslipidaemia, castenosis. Sy inhibiting CETP, the levels of HDL and low angioplastic restenosis. By inhibiting CETP, the levels of HDL and low density lipoproteins (LDL), and the HDL:LDL ratio are favourably altered consity libozofens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (a decrease in LDL levels, and a corresponding increase in HDL levels). The HH ribozymes can also be used diagnostically to study genetic drift and mutations in diseased cells, and to detect CETP mRNA. As the HH ribozymes target specific regions of the CETP gene, they have low non-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

Pape M;

AAT 49608-T49863 represent target sequences for the human cholesterol ester transfer protein (CETP) hammerhead (HH) ribozymes (see AAT49881-510137). CETP: is a 74 kD glycoprotein that facilitates neutral lipid transfer between plasma lipoproteins. The numbering of the targets refers to the position of the cleavage site in full length CETP. The ribozyme binds to 5 nucleotides either side of this site, provided the sequence UH is immediately upstream. The ribozymes are able to cleave mRNA from the gene encoding CETP, thereby blocking synthesis and/or expression of the sequence of mRNA. By inhibiting CETP, the reverse cholesterol transport (RCT) pathway can be inhibited (or eliminated) thereby preventing the reduction in size density of the high density lipoproteins (HDL), prolonging HDL half life, and therefore increasing HDL levels of CETP, specifically familial conditions associated with abnormal levels of CETP, specifically familial hypercholesterolaemia, atherosolerosis, peripheral vascular disease, hyperbetalipoproteins (HDL), and the HDL:LDL ratio are favourably altered angioplastic restenosis. By inhibiting CETP, the levels of HDL and low density lipoproteins (LDL), and the HDL:LDL ratio are favourably altered and mutations in diseased cells, and to detect CETP mRNA, As the HH contains in diseased cells, and to detect CETP mRNA, As the HH contains in diseased cells, and to detect CETP mRNA, as the HH contains in diseased cells, and to detect CETP mRNA, as the HH contains in diseased cells, and to detect CETP mRNA, as the HH contains in diseased cells, and to detect CETP mRNA, as the HH contains in diseased cells, and the CETP gene, they have low nonspecific activity

functioning as promoters for the tetracycline resistance (TetR) gene.

functioning as promoters for the tetracycline resistance (TetR) gene.

They are derived from the -35 promoter sequence of the TetR gene of

They are derived from the -35 promoter sequence of the TetR gene of

The specification describes a method for obtaining an oligonucleotide

that confers a predetermined biological function, such as regulation of

expression or a biological activity of a polypeptide, on a cell. The

method comprises cloning a heterogeneous pool of oligonucleotides into an

expression vector, where the clones oligonucleotides are transcribed or

act as regulatory sequences, introducing a random sample of the cloned

coligonucleotides into a population of cells that do not exhibit the

predetermined biological function, selecting a subpopulation of cells

exhibiting the predetermined biological function, and isolating an

coligonucleotide that confers this function from the selected

subpopulation of cells. The process is used, for example, for identifying

new forms of the Escherichia coli tetracycline resistance gene promoter
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Identification of biologically active DNA sequences - by transforming cells with random oligo-nucleotide (s).

```
The present invention relates to an oligonucleotide array comprising oligonucleotide tags fixed to a solid substrate. The oligonucleotide array is useful for genotyping a nucleic acid sample at one or more locivia single base extension (SBE) reactions. A pair of primers is used to amplify a polymorphic locus in a sample e.g. a single nucleotide polymorphism (SNP). The present sequence is one of the primers used in the method of the present invention to amplify a polymorphic sample. The amplified nucleic acid product is then used as a template in a SBE reaction with an extension primer. The SBE reaction products are used to form the oligonucleotide array
                                                                                                                                                                                                                                                                                                                                                                                   Universal array of oligonucleotides tags attached to a solid substrate along with locus-specific tagged oligonucleotides useful in genotyping using single base extension reactions.
                                                                                                                                                                                                                                                                                             Hirschhorn JN, Huang X, Kaplan P, Lander ES, Lockhart DJ;

WO200078341-A1

28-DEC-2000

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleoride, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, conjugance and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the antisense oligonucleotide which can be useful for ameliorating the effects of psoriasis, chthyosis, pityriasis, ubb, pliaris, serborrhoea, keloids, keratosis, ichthyosis, pityriasis, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the skin, a chyperneovascular design and proper of the inside of blood sease, phyperproliferation of the inside of blood seases and the property of the inside of blood seases and the property of the inside of blood seases. Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or Sequence 15 BP; 2 A; 3 C; 7 G; 3 T; 0 U; 0 Other; Edmondson SR; (MURD-) MURDOCH CHILDRENS RES INST. The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligomucleotide, (for Insulin-like Growth Factor [167]-1 receptor, 1GF binding protein [1678]-2 or 1GFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inhibiting or reducing growth factor mediated cell proliferation, configuration and/or other disorders. The present sequence is an oligomucleotide which can be used to design the antisense oligomucleotide which can be useful for ameliorating the effects of psoriasis, season playsis, plyriasis, ruba, pilaris, senborrhoea, keloids, keratosis, neoplasis, soleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, chain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood to sessels or any other hyperplasia Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or Werther GA, Edmondson SR; Example 8; Page 90; 201pp; English. (especially allele-specific oligonucleotides (ASO)) for detecting a polymorphism in the CRYBB1. The isogenes or haplotypes are useful for improving the efficiency and reliability of several steps in the discovery and development of drugs for treating diseases associated with CRYBB1 activity, e.g. cataract. and can also be used by the pharmaceutical research scientist to validate CRYBB1 as candidate target for, and in design of clinical trials of candidate drugs for, treating a specific condition drugs or disease predicted to be associated with CRYBB1 activity. The ASOs are useful as probes and primers, and for assaying a polymorphism in the target region. The present sequence is a pcr primer which amplifies a region of CRYBB1 containing one of 12
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Detecting a base at a pre-determined position in a nucleic acid molecule, comprises performing primer extension reactions using base-specific detection primers in the presence of a nucleotide-degrading enzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to a method for detecting a base at a predetermined position in a nucleic acid molecule. The method comprises performing primer extension reactions using base specific detection primers, each being specific for a particular base at the predetermined position. The allele-specific (AS) primer extension assay method of the invention is useful for detecting an allele-specific base at a predetermined position in a nucleic acid molecule, for high throughput single nucleotide polymorphism (SNP) analysis, and for detecting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human, allele-specific base detection; primer extension reaction; base-specific detection primer, allele-specific primer extension assay; AS; high throughput; single mucleotide polymorphism; SNP analysis; mutation detection; genetic variation; allele-specific extension; probe;

The present invention relates to a novel method of producing a stabilised double D loop at a target sequence within a double-stranded nucleic acid. The method involves contacting the double-stranded nucleic acid with an oligonuclectide having a first and second strand with at least a region of complementarity in between them. The first oligonuclectide strand has a region that is complementary to a first strand of the target and binds to the recombinase while the second strand is not bound. The methods, oligonuclectides, compositions and kits are useful for detecting and purifying known nucleic acid targets and for manipulating defined nucleic acid target sequence is an annealing oligonuclectide for Kan- target. This sequence is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Producing a stabilized double D loop at a target sequence within a double stranded nucleic acid comprises contacting the nucleic acid with an oligonucleotide having a first and second strands with a region of
mutations and genetic variations. The new method solves the deficiencies of previous methods by providing a method of allele-specific extension that allows accurate discrimination between matched and mismatched configurations, as well as reducing or eliminating false positive results observed in prior art. The use of two allele-specific primers increases the sensitivity by a factor of two because signals of two extensions are obtained. The present sequence represents a probe used in the examples of
                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                          2.9%; Score 12.4; DB 1; Length 15; 92.9%; Pred. No. 2.9e+02; rive 0; Mismatches 1; Indel8

The present invention relates to a novel method of producing a stabilised double D loop at a target sequence within a double-stranded nucleic acid. The method involves contacting the double-stranded nucleic acid with an oligonucleotide having a first and second strand with at least a region of complementarity in between them. The first oligonucleotide strand has a region that is complementary to a first strand of the target and binds to the recombinase while the second strand is not bound. The methods, oligonucleotides, compositions and kits are useful for detecting and purifying known nucleic acid targets and for manipulating defined nucleic acid target sequences. The present sequence is an oligonucleotide which is used for determination of optimal oligonucleotide composition for the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       double D loop at a target sequence within a double-stranded nucleic acid.

The method involves contacting the double-stranded nucleic acid with an oligonucleotide having a first and second strand with at least a region of complementarity in between them. The first oligonucleotide strand has a region that is complementary to a first strand of the target and binds to the recombinase while the second strand is not bound. The methods, oligonucleotides, compositions and kits are useful for detecting and purifying known nucleic acid targets and for manipulating defined nucleic generate neomycin phosphorransferase mutant (Kan-) gene. This sequence is used in the exemplification of the invention
                                                                             ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Producing a stabilized double D loop at a target sequence within a double stranded nucleic acid comprises contacting the nucleic acid with an oligonucleotide having a first and second strands with a region of complementarity in between.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a novel method of producing a stabilised double D loop at a target semience within a double D loop at a target semience within a double D
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The present invention relates to a novel method of producing a stabilised double D loop at a target sequence within a double-stranded nucleic acid. The method involves contacting the double-stranded nucleic acid with an oligonuclectide having a first and second strand with at least a region of complementarity in between them. The first oligonuclectide strand has a region that is complementary to a first strand of the target and binds to the recombinase while the second strand is not bound. The methods, oligonuclectides, compestions and kits are useful for detecting and purifying known nucleic acid targets and for manipulating defined nucleic acid target sequence is a locked nucleic acid (IMA) which is used as an annealing oligonuclectide for Kan- target. This sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                       Producing a stabilized double D loop at a target sequence within a double stranded nucleic acid comprises contacting the nucleic acid with an oligonucleotide having a first and second strands with a region of complementarity in between.

The present invention relates to a novel method of producing a stabilised double D loop at a target sequence within a double-stranded nucleic acid. The method involves contacting the double-stranded nucleic acid with an oligonucleotide having a first and second strand with at least a region of complementarity in between them. The first oligonucleotide strand has a region that is complementary to a first strand of the target and binds to the recombinase while the second strand is not bound. The methods, oligonucleotides, compositions and kits are useful for detecting and purifying known nucleic acid targets and for manipulating defined nucleic acid target sequences. The present sequence is an oligonucleotide which is used for double D-loop formation. This sequence is used in the
                                                                                                                                                                                                                                      Producing a stabilized double D loop at a target sequence within a double stranded nucleic acid comprises contacting the nucleic acid with an oligonucleotide having a first and second strands with a region of complementarity in between.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Nucleic acid molecule; Hepatitis C virus; HCV; Hepatitis B virus; HBV; RNA stability; RNA expression; RNA synthesis; antisense; enzymatic nucleic acid; hammerhead ribozyme; DNAzyme; inozyme; amberzyme; G-cleaver ribozyme; decoy molecule; aptamer; HBV reverse transcriptase; Enhancer I region; anti-HCV; viral replication; degenerative; disease state; HBV infection; HCV infection; cirrhosis; liver failure; hepatocellular carcinoma; hepatotropic; cytostatic; virucide; antiinflammatory; substrate; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a novel method of producing a stabilised double D loop at a target sequence within a double-stranded nucleic acid. The method involves contacting the double-stranded nucleic acid with an oligonuclectide having a first and second strand with at least a region of complementarity in between them. The first oligonuclectide strand has a region that is complementary to a first strand of the target and binds to the recombinase while the second strand is not bound. The methods, oligonuclectides, compositions and kits are useful for detecting and purifying known nucleic acid targets and for manipulating defined nucleic acid target sequences. The present sequence is an annealing oligonuclectide for Kan- target. This sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Producing a stabilized double D loop at a target sequence within a double stranded nucleic acid comprises contacting the nucleic acid with an oligonucleotide having a first and second strands with a region of complementarity in between.

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HEV) or Hepatitis B virus (HEV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, inczymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed zeroscriptase and/or HEV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV genes and incleic acids may be used to modulate the expression of HBV genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds and methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene carcinoma. The present sequence represents a substrate for one of the carcinoma. The present sequence espeseents a substrate for one of the carcinoma. The present sequence represents a substrate for one of the
                                                                                                                                                                                        Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus
                                                                                                                               Mcswiggen J, Morrissey D, Pavco P, Lee P;

infection.

```
The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HRV) or Hepatitis C virus (HCV) or an enzymatic nucleic acids such as harmerhead ribozymes, DNAzymes, and enzymatic nucleic acids such as harmerhead ribozymes, DNAzymes, and enzymatic nucleic acid decoy molecules and G-cleaver ribozymes, Also disclosed are nucleic acid decoy molecules and G-cleaver ribozymes, Also disclosed transcriptase and/or HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds and chose the invention and dofor replication of HCV. The compounds and disease states related to HBV and HCV infection, replication and generative and disease states related to HBV and HCV infection, replication and generations. The present sequence represents a target for one of the anti-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Microarray; probe; Mycobacterium; antibiotic-resistance; genotyping; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

Kim C,

```
The present sequence is that of kan klo3, an oligonucleotide mismatched (non-hybridising) to the triplet repeat region of exon 1 of the human thurtington's disease (HD) gene. The oligonucleotide is modified by including locked nucleic acid (INA) residues at both ends. Administration of this short, modified oligonucleotide to neuronal PC12 cells bearing an protein (huntingtin) aggregation in cell culture studies. The invention relates to oligonucleotides, including oligonucleotides containing LNA modifications, that alter the genomic HD gene sequence and/or reduce the propensity of huntingtin to form intracellular aggregates. These can be used for the treatment or prevention of HD
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New single stranded oligonucleotides comprising a DNA domain having at least one mismatch with respect to the genetic sequence of the Huntington's disease gene to be altered, useful for treating or preventing Huntington's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  2.9%; Score 12.4; DB 1; Length 15; 92.9%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a microarray comprising a support, a first probe for genotyping Mycobacterium species, second probe for differentiating Mycobacterium tuberoulosis strains, and a third probe for detecting antibiotic-resistant strains, where the probes are immobilized on the support. This sequence represents an example of the first probe used for genotyping Mycobacterium species. The array is useful for simultaneously genotyping Mycobacterium species, differentiating M. tuberculosis strains and detecting antibiotic-resistant strains

The oligonuclectide is modified by having locked nucleic acid (LNA) residues throughout its length. Administration of this short, modified oligonuclectide to neuronal PC12 cells bearing an protein (huntingtin) aggregation in cell culture studies. The invention relates to oligonuclectides, including oligonuclectides containing LNA modifications, that alter the genomic HD gene sequence and/or reduce the propensity of huntingtin to form intracellular aggregates. These can be used for the treatment or prevention of HD
                                                                                                                                                                                                          New single stranded oligonucleotides comprising a DNA domain having at least one mismatch with respect to the genetic sequence of the Huntington's disease gene to be altered, useful for treating or preventing Huntington's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

```
The present sequence is that of single-stranded oligonucleotide Kan MuklSG, which has 2'0-Me modifications throughout its length.

Administration of this oligonucleotide to PCI2 neuronal cells containing an engineered Huntington's disease (HD) gene exon 1 including alternating, repeating Gln codons (CAA/G) had little effect on HD protein (huntingtin) aggregation. This was in contrast to other modified oligonucleotides (see ABZB173'-39) which, although non-specific and non-hybridising to the HD gene, and being incapable of directing sequence hybridising of the tripler repeat region of exon 1, nevertheless reduced the formation of HD protein aggregates. Such oligonucleotides can be used for the treatment or prevention of HD
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to distinguishing presence of a nonsupercoiled target tonsupercoiled target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Distinguishing nonsupercoiled target nucleic acid in sample of nucleic acids from variants of the target, by forming deproteinization-stable double D loops in target query region which distinguish target from
                                                                                                                                                 New single stranded oligonucleotides comprising a DNA domain having at least one mismatch with respect to the genetic sequence of the Huntington's disease gene to be altered, useful for treating or preventing Huntington's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    nonsupercoiled nucleic acid; target query region; genotyping; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1; Indels : 0;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is that of single-stranded phosphorothioate oligonucleotide Kan ub77/15G, Administration of this oligonucleotide to oligonucleotide collegues of the soligonucleotide to PC12 neuronal cells containing an engineered Huntington's disease (HD) sense exon including alternating, repeating Gln codons (CAA/G) resulted in a reduction in the formation of HD protein (Muntingtin). Kan ub77/15G is an example of modified oligonucleotides of the invention, which although non-specific and non-hybridising to the HD gene, and incapable of directing sequence alternation of the triplet repeat region of exon 1, nevertheless reduce the formation of HD protein aggregates. Such oligonucleotides can be used for the treatment or prevention of HD
                                                                                                                                                                                                                                                                                       New single stranded oligonucleotides comprising a DNA domain having at least one mismatch with respect to the genetic sequence of the Huntington's disease gene to be altered, useful for treating or preventing Huntington's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The present invention relates to distinguishing presence of a nonsupercoiled target nucleic acid from presence of nonsupercoiled target nucleic acids the variants differing from target by a nucleotide within a sample of nucleic acids, the variants differing from target by a nucleotide within a common target query region (TQR). Involving using a recombinase to mediate formation of deproteinization stable double D loops in TQR and then distinguishing degree of formation of double D loops that are stable to deproteinization. The method is useful for distinguishing the presence of a nonsupercoiled target nucleic acid such as a linear duplex DNA, covalently closed circle, or artificial chromosome from the presence of nonsupercoiled target variants within a sample of nucleic acids and is also useful for targets within the sample of nucleic acids and is also useful for separating a nonsupercoiled double- stranded nucleic acid target from the proposed of the sample of nucleic acids within a multiplexed permitting a large number of loci to be greened within a multiplexed permitting a large number of loci to be greened within a
where 10-10000 fold purification is effected. The methods are readily multiplexed, permitting a large number of loci to be screened within a single sample, may be adapted to a variety of existing detection systems, and permit target amplification without PCR, increasing fidelity. The ability to separate desired double stranded targets with allelic selectivity, withour contemporaneous detection, offers significant advantages over current genotyping methods. The present sequence is an oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         single sample, may be adapted to a variety of existing detection systems

The invention relates to a novel method for amplifying a DNA using polymerase chain reaction (PCR) comprising synthesising the first region of a base sequence to be amplified by designing a pair of primers so as to place the first region between them and to anneal each other at the 3-end and carrying out a polymerase chain reaction (PCR) using the primers. Subsequently, the second region is synthesised by designing a pair of primers so as to place the second region partly overlapping with the first region of the base sequence between them and to anneal each other at the 3'-end and carrying out a PCR using the primers. Pinally, the first region is annealed to the second region generating the template to carry out a PCR and thus to synthesize a base sequence containing the first and the second regions. The method of the invention may be useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Amplification of a DNA, a gene encoding the repeated sequence of an amino
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       sequence is that of the mucin-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                             Gaps
and permit target amplification without PCR, increasing fidelity. The ability to separate desired double stranded targets with allelic selectivity, with or without contemporaneous detection, offers significant advantages over current genotyping methods. The present sequence is an oligonucleotide of the invention.

The inventors claim an oligo-peptide-carrier conjugate in which the three moieties are covalently linked to one another. The peptide provides a cleavable linker which is cleaved by enzymes which do not degrade antisense oligos (ODNs). The ODN-targeting ligand linkage must be stable to serum proteases, yet cleaved by the lyosocmal enzymes in the target cell. The method involves conjugation of an ODN bearing an electrophilic crosslinking gp. to a peptide which bears two mucleophilic gps of differing reactivity. The resulting ODN-peptide conjugate is prepd. to that a nucleophilic handle remains on the peptide. This gp. is used to turher attach the lyosomotropic carrier to the peptide portion of the ODN-peptide conjugate. The peptide is therefore aslo used as a beterobifunctional linker. Two different model ODNs were used - ODNI and connective is complementary to the intiation codon region of the RNA transcript for the Hepatitis B surface antigen in Hep3B cells. (Updated on 25-WAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                     New covalently linked conjugates of oligo:nucleotide, peptide and carrier - utilising surfactant, poly:amine or targetting ligand as lyso somotropic drug carrier.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     PCR; primer; amplification; promoter; graminaceous plant; rice; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This is a ACE mRNA target sequence (nucleotide no. 1771) of an enzymatic RNA molecule (ribozyme) which cleaves mRNA associated with the development or maintenance of a cardiovascular condition. The concn. of the ribozyme necessary to effect a therapeutic treatment is lower than that of an antisense oligomocleotide and the specificity of action is higher. (Updated on 25-WAR-2003 to correct PN field.)

This is the nucleotide sequence of a PCR primer used in the amplification of the Rice tungro bacilliform virus (RTBV) promoter. The isolated genome Length transcript promoter from RTBV is used for driving gene expression in the vascular bundles of gramminaceous plants, especially rice, especially where the gene encodes a protein conferring a desired
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New polynucleotides encoding full-length polypeptides, e.g. secretory and/or membrane proteins, useful for developing medicines for diseases in

The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VBGF). A partent (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (fL-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour angiogenesis, coular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX7575 represent specific examples of nucleic acid molecules from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1; KDR; hammerhead ribozyme; hairpin ribozyme; cleavage; trumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor; foetal liver kinase 1; 88.
